Numerical Analysis 2 credits	Probability Models 2 credits
Elective Required	Elective Required
Professor Naofumi Ohnishi	Associate Professor Reika Fukuizumi
Students will be taught the numerical analysis techniques which provide the basis for analysis in fluid dynamics, thermodynamics, mechanics, electromagnetics and measurement and control engineering, etc., and learn how to apply these skills. Classes will focus in particular on (1) numerical solutions for ordinary differential equations (2) the finite difference method and the finite element method for partial differential equations, and (3) linear algebra and numerical optimization methods, covering the basics of numerical analysis and their engineering applications.	Mathematical analysis is important for the understanding of random phenomenon appearing in various fields of natural, life and social sciences, and the probabilistic approach is essential. We start with fundamental concepts in probability theory and learn basic tools for probabilistic models. In particular, for the time evolution of random phenomenon we study basic properties of random walks, Markov chains, Markov processes, and take a bird's-eye view of their wide applications. These lectures will be in Japanese in principle and an English resume will be distributed.
Fluid Dynamics 2 credits	Solid Mechanics 2 credits
Elective Required Professor Masaya Shigeta Students acquire the intuition and knowledge of the nature of fluid motion by studying the fundamentals of Fluid Dynamics with not only theories but also visualized images, observation videos, and computer graphic animations. The goal is for students to be able to predict the fluid motion and to design the control methods in aerodynamic and material processing applications. Keywords: Vortex, Convection, Stream/Path/Streak lines, Incompressibility/Compressibility, Conservation laws, Bernoulli's theorem, Viscosity and diffusivity, Boundary layer, Aerodynamic	Elective Required Associate Professor Yoshiteru Aoyagi This class is designed to provide students with a comprehensive understanding of deformation of solids and covers the fundamentals of continuum solid mechanics. It focuses on two- dimensional elasticity in infinitesimal strain theory, the concept of strain and stress, and the introduction of general methods of solving the boundary value problems through the specific problems. Moreover, this class also covers the fundamentals of finite deformation theory, which is used for addressing the large deformations of solids.
force, Laws of similarity, Reynolds number, Strouhal number and Kármán's vortex street, Analogy with heat and mass transfers, Navier-Stokes and wave equations. Thermal Science and Engineering A 2 credits	Thermal Science and Engineering B 2 credits
Elective Required	Elective Required
Professor Hideaki Kobayashi	Professor Taku Ohara
Professor Kaoru Maruta	Professor Tetsushi Biwa
Professor Takashi Tokumasu Associate Professor Hisashi Nakamura	Professor Atsuki Komiya Associate Professor Gota Kikugawa
In this course, students will master the basic physics of reactive flows in thermal fluid science. In particular, the course is designed to cover flame behaviors and peculiar phenomena in laminar and turbulent combustion, the basic concept of chemical kinetics and the understanding of reaction phenomena of electrochemistry on the standpoint of thermal science. Through the class, students will further deepen their understanding of the essence of thermal phenomena and will become able to apply this to practical devices.	The students will master the basic physics of thermal energy conversion and heat transfer in both micro and macroscopic scales, and learn to link this knowledge to engineering applications. More specifically, the series lectures: i) the Molecular Dynamics and molecular-scale analyses of thermo-fluid phenomena, ii) oscillating-flow based heat transfer and energy conversion, iii) visualization and control of multi-scale heat and mass transfer, and iv) statistical mechanics regarding interface phenomena will be done. Students are expected to further deepen their understanding of the essence of thermal phenomena.
System Control Engineering I 2 credits	System Control Engineering II 2 credits
Elective Required Professor Koichi Hashimoto Professor Yasuhisa Hirata	Elective Required Professor Kazuya Yoshida Associate Professor Yusuke Tamura
New mechanical systems using advanced mechanisms are being developed in a range of areas for medical care and welfare, space exploration, disaster rescue purposes and so on. This course focuses on motion control design of increasingly advanced and complex mechanical systems. Students will learn fundamentals for non-linear system analysis and control system design methods. First, phase plane analysis methods and Lyapunov methods are introduced as the main ways to analyze non-linear systems. Next, non-linear feedback control system design methods that can be used for mechanical control systems with non-linear dynamics. Finally, students look at several control system design methods.	This course gives an advanced lecture based on the contents of "System Control Engineering I." This lecture introduces the analysis and design methods of control systems used for designing motion control for increasingly advanced and complex mechanical systems. Students will learn fundamental concepts for state and output feedback in the state space, state observer and Kalman filter, and response analysis of control systems. This class includes some exercises using MATLAB.

Materials Chemistry 2 credits	Computer Hardware Fundamentals 2 credits
Elective Required Professor Yutaka Watanabe Professor Koji Amezawa Professor Eiji Akiyama Associate Professor Yoichi Takeda	Elective Required Professor Tetsu Tanaka Professor Hiroyuki Takizawa
Most metals in the earth's atmosphere inevitably change into more thermodynamically stable compounds such as oxides or sulfides. To understand this principle more precisely, students will learn chemical and electro-chemical equilibrium theory, and kinetics theory in relation to corrosion and oxidation of metals. Practical examples will be used to explain the phenomena and theories of wet corrosion and high-temperature oxidation, deepening students' understanding of the chemical and electro-chemical reactions related to macro phenomena of corrosion and oxidation. This course will be offered in English with a lecture and practice style, using English-language materials. A detailed outline of the course will be presented during the first class.	Computers have become an indispensable part of modern society. In this course, both VLSI technology and computer architecture will be lectured for better understanding of modern computer systems. First, CMOS-IC Technology, memory technologies, circuit architecture, high-level synthesis and integrated design technologies that support a remarkable evolution of computer systems over the past few decades will be introduced. Then, the topics will move to computer architecture that focuses on the structure of computer systems, issues and tradeoffs involved in the design of computer system architecture, and high-performance computing. Also, research topics on state-of-the-art LSI technology and computer architecture will be also presented in the lecture.
Solid State Physics 2 credits	Mechanics of Plasticity 2 credits
Elective Required Professor Hiroo Yugami Professor Takahito Ono Professor Ying Chen	Elective Required Professor Toshiyuki Hashida Associate Professor Yoshiteru Aoyagi
This course targets students from mechanical engineering, system engineering and a wide range of other specialized areas. Using Introduction to Solid State Physics (Charles Kittel, Eighth Edition) as the main text, it focuses on the fundamentals of material science. Following the chapter order in this text book, each class will cover the content associated with that chapter. The course aims to provide students from a wide range of areas with an understanding of the basics concept of solid state physics and a broad perspective on the behavior of materials in engineering systems.	This lecture covers the concepts and analytical methods that form the basis of plastic deformation mechanics, including material strength and fracture, deformation processing and tribology, and learn how to apply these skills. Key themes will be (1) basic concepts in plastic deformation, (2) mechanical description of plastic deformations, (3) finite element analysis and (4) using case studies to consider applications to engineering. This lecture aims to have students understand and master basic concepts in mechanical descriptions of plastic deformation.
Structure and Function of Living System 2 credits	Robot Vision 2 credits
Elective Required Professor Yoichi Haga Professor Makoto Ohta Professor Takuji Ishikawa	Elective Required Professor Takayuki Okatani
In all types of engineering with a connection to the human body, a thorough understanding of the structure and function of the human body and other living systems is vital, as is consideration of systems geared to the special features of these living systems. This course covers the biology knowledge in terms of the basic functions and structures of living organisms that forms the basis of bioengineering. Particular emphasis will be placed on the basic knowledge and approaches necessary for deep exploration of the anatomy and physiology of the human body from the perspective of biomechanics.	This course explains various problems and their solutions in computer vision. The problems are basically inverse-problems in which we wish to estimate some information about an object or a scene from their image(s), such as the three-dimensional shape of a scene or the categories of object. Students will first learn a series of fundamental concepts, and then study a number of approaches to the problems of computer vision, where the main focus is on the recently developed deep learning methods.

Digital Signal Processing 2 credits	Introduction to Mechanics and Physical Mathematics
Elective Required Associate Professor Shingo Kagami Associate Professor Toshinori Kuwahara	2 credits Elective Required Professor Tomonaga Okabe
This lecture covers fundamentals of digital signal processing that provides a foundation for sensing, control, communication, voice processing, image processing, and so forth. Related subjects include discrete-time signals, discrete-time and discrete Fourier transformations, sampling, digital frequency analysis, discrete- time systems, z transformation, digital filtering, and some more advanced topics.	In the modeling of classical mechanics, we often meet the applied mathematics, such as differential geometry or manifolds theory. These have been developed from the viewpoint of mathematical universality and do not always provide new ideas directly. But, we often need such a background to make the theoretical models. Furthermore, symbols and calculations developed in these fields are not commonly used by general engineering students or graduate students of engineering, and this is considered to be an obstacle for learning them. In this lecture, I am going to introduce those mathematical expressions as simple as possible, so that the students can employ the advanced mathematics in the general mechanical engineering field. This course can also be considered as an introduction to the tools of physical mathematics.
Continuum Mechanics 2 credits	Applied Fluid Mechanics 2 credits
Elective Required Professor Takuji Ishikawa	Elective Required Professor Jun Ishimoto Professor Yuka Iga
Materials may be regarded as continuum at the macroscopic scale. In this lecture, we aim to mathematically understand the motion and deformation of materials, such as solid and fluid, at the macroscopic scale. We first explain the concepts of continuum and stress as well as vector/tensor analysis. We then derive basic equations describing the motion and deformation of continuum, such as equilibrium equation, constitutive equation and boundary conditions. This lecture is the basis of solid and fluid mechanics, which is recommended to students who want to establish a whole picture of both subjects.	This lecture will be given on the fundamentals and applications of multiphase fluid dynamics and numerical analysis related to the fluid dynamic phenomena with heterogeneous interfaces, gas- liquid two-phase flow, phase change, cavitation, and the fundamentals of turbo-type fluid machinery such as pumps and turbines. The main topics to be understand are as follows. 1) Flow pattern and classification method of gas-liquid two-phase flow, 2) Fundamentals of two-fluid model, 3) Modeling of dispersed multi- phase flow and numerical analysis, 4) Modeling of liquid atomization 5) Classification and role of fluid machinery 6) Generation of cavitation in pumps.
Structural Mechanics 2 credits	Nano/Micro Tribology 2 credits
Elective Required Professor Kanjuro Makihara	Elective Required Professor Koshi Adachi
This lecture gives a fundamental knowledge on the structural analysis and the structural design of mechanical structures. Main topics of this lecture are deformation and stress analyses of fuselage and wing structures subjected to bending, twisting and shear. (1) Fundamental of mechanical structure and material strength. (2) Vibration analysis for structures. (3) Applied load and stress analysis of mechanical structures. (4) Structural identification and structural health monitoring (5) Structural mechanics for aerospace engineering.	Many contact interfaces exist in one machine or device, and they have strong effects on the performance of the machine or device. Performance of machines and devices are sometimes limited by such contact interfaces. Microscopic design of contact interfaces becomes important and necessary as the size of a machine or device becomes smaller or thinner together with higher performance and accuracy. Principal properties of surfaces and contact interfaces will be explained in this lecture for such needs, and fundamentals and applications of friction and wear will be introduced.
Micro-Nanomechanical Architectonics 2 credits	Energy Systems Engineering 2 credits
Elective Required Professor Takahito Ono Associate Professor Masaya Toda	Elective Required Professor Hiroo Yugami
Designing of mechanical system based on nanotechnology is an intellectual task combining large amount of information and wide experimental knowledge. In this class, the fundamental knowledge and designing theories of the highly developed micro machines for each process of their planning, fabrication and evaluation are presented. The processes to combine mechanics, electronics, fluidics and optical components in the design of micro mechanics, the examples of modelling, simulation and fabrication of the devices, and the evaluation and the optimization of design are lectured with several trial examples of actual designs.	There are serious energy and environmental issues for the Earth and humanity. Solving the issues will demand effective usage of non-renewable energy sources and growth in the use of renewable energy generation systems. For such a purpose, new technologies for energy conversion and energy policy must be important. In this lecture, new energy conversion technologies such as fuel cells are introduced. Students also investigate energy technologies and energy policy. Based on the information, students will think current state of the energy system and the future through discussion.

Oxidation in High Temperature Environments of Structures	Functional Fluids Engineering 2 credits
and Materials2 creditsElective RequiredProfessor Kazuhiro OgawaAssociate Professor Yoichi TakedaAssociate Professor Ken SuzukiDue to improve the operation efficiency, gas temperature of energy conversion systems, such as gas turbines and boilers, gradually increases. As a result, degradation of the structures, such as high- temperature creep, low cycle fatigue or high-temperature oxidation and corrosion, etc. may be occurred. These damages are called "aged deterioration" or "degradation".In this lecture in the first half, the degradation in the energy conversion systems especially high-temperature oxidation is lectured, and the mechanism of high-temperature oxidation is explained. And in this lecture in the second half, presentation and discussion concerning high-temperature oxidation behavior of structures and materials are conducted.	Elective Required Professor Takehiko Sato Professor Masaya Shigeta Professor Hidemasa Takana This course covers fluids that express functionality depending by external fields. We discuss fundamentals of fluids' structure, mechanism of exhibiting the functionalities, transport phenomena, governing equations, and diagnostic method for the functional fluids such as plasma fluid, magnetic fluid, MR or ER fluids, ionic liquid. Also, regarding advanced applications using functionalities of those fluids, we outline plasma medicine, environmental remediation, material processing, energy equipment and other topics.
Mechanical Systems Maintenance Engineering 2 credits Elective Required	Introduction to Solid State Ionics 2 credits Elective Required
Professor Tetsuya Uchimoto	Professor Koji Amezawa Associate Professor Takashi Nakamura
In large-scale, complicated artifacts such as various industrial plants and airplanes, maintenance activities play an important role to prevent loss of function of the systems due to aging degradation. Optimization of the maintenance activities in view of both system safety and economic performance is placed as a major key challenge. In this course, we outline the disciplines composing maintenance engineering such as reliability engineering, materials degradation, risk evaluation, nondestructive testing, failure analysis. In addition, recent works will be introduced: such as a novel health monitoring system, a vibration control system, and so on.	In this lecture, ionic transport phenomena in solids will be discussed. Ions in ceramics, ionic crystals, and inorganic glasses can move in varying degrees. Particularly solids showing excellent ionic conduction are called as solid state ionic conductors, and utilized as electrolytes or electrodes of fuel cells, batteries, and electrochemical sensors. In this lecture, basics of solid state ionics, such as mechanisms of ionic conduction in solid, will be first explained, and then advanced applications of solid state ionic conductors will be introduced.
Ultraprecision Machining 2 credits Elective Required Associate Professor Masayoshi Mizutani	Manufacturing Systems2 creditsElective RequiredAssociate Professor Masayoshi MizutaniAdjunct Instructor Makoto SanoAdjunct Instructor Takashi Genma
Focusing on description of the principles, technologies and applications achieving both the ultra-precise form accuracy and ultra-smooth surface roughness. The purpose of this course, especially, is to deepen understanding of Ultra-precision machining technology focusing on micro-mechanical machining, non-conventional processing or additive manufacturing.	This class is included two topics. One is focusing on description of the fundamental principles and applications for intelligent CNC machining centers and industrial robots for industrial production. Machining center, Control system of CNC machine, Mechanisms and control for robot, Sensing system for robot, Software and language for robot, CAD/CAM and FMS, ultra-precision machine. The other is focusing on an optical instrument for LSI manufacturing systems. Design and manufacture of optical lenses, Mechanisms and control of AF/AE camera, Microscope and telescope, Laser interferometer measuring instrument, LSI production, Stepper.

Earth Systems Design 2 credits	Neuromorphic Device Engineering 2 credits
Elective Required Professor Toshiyuki Hashida	Elective Required Professor Tetsu Tanaka
r rolessor Toshiyuki Hashida	Associate Professor Takafumi Fukushima
	Associate Professor Takafumi Fukushima

learning theory as well as stochastic processes. Brief introduction will be given to methods for applications like statistical estimation etc., and to the relationship with statistical-mechanical informatics. We first lecture probability and statistics and their fundamental properties and explain the basic frameworks of Bayesian estimation and maximum likelihood estimation. Particularly, we show EM algorithm as one of familiar computational schemes to realize the maximum likelihood estimation. As one of linear statistical models, we introduce Gaussian graphical model and show the explicit procedure for Bayesian estimation and EM algorithm from observed data. We show some useful probabilistic models which are applicable to probabilistic information processing in the stand point of Bayesian estimation. We mention that some of these models can be regarded as physical models in statistical mechanics. Fundamental	respectively. In this lecture, students learn about current status and issues related to environmental policies of Miyagi Prefecture and Sendai City (about climate change such as global warming, promotion of waste reduction and recycling including plastic recycling, and environment-related laws) to achieve environmental conservation and sustainable society, and learn about environmental policies and environmental technologies. In addition to lectures, this course can help students acquire practical knowledge and develop their ability to think about how to

Ethics of Engineering and Life 2 credits	Internship Training 1 or 2 credits
Elective Required Professor Tetsutaro Hattori	Elective Required All teachers
We will study wide range of ethical issues including "research ethics", which are important for researchers and engineers. Not only medical science but also engineering is closely related to "life". Applying some engineering technologies to various fields such as medicine and food productions, we undoubtedly face the matter of life and death in humans and other creatures. The intrinsic influence of engineering is huge, which requires us to acquire sophisticated knowledge and learn the ethical norm. We will invite experts engaged in various fields to give lectures. We will also arrange group discussion and presentation.*Note for foreign students: Lectures are given in Japanese. In slides and handouts, some lecturers give titles etc. both in Japanese and English, but others do not.	Practical training and research conducted at a company for around one week to one month in the first-year of masters program. Through this training, students learn how to apply the basic research at university to a real industrial technology setting. Additionally, students gain on-site experience and understand the realities of planning, surveys and research, product development, manufacturing and product management, etc., in companies. It is desirable that all students take this training. One or two credits are given to them according to the content and the period of the training.
International Scientific Internship Training 1 or 2 credits	Special Lecture on Mechanical Systems Engineering A 1 or 2 credits
Elective Required All teachers	Elective Required Various teachers
When students have attended any lectures or practiced in a foreign academic organization or science program, one or two credits are given to them according to the content and the period.	A special lecture on leading-edge academic research in the major area, or on the creation and development of knowledge in relation to the major area.
Special Seminar on Mechanical Systems Engineering A 1 or 2 credits	Seminar on Mechanical Systems 2 credits
Elective Required Various teachers	Elective Required Professor Koshi Adachi Professor Takahito Ono Professor Kazuhiro Ogawa Professor Toshiyuki Hashida Professor Tetsu Tanaka Associate Professor Masayoshi Mizutani Associate Professor Masaya Toda Associate Professor Kazuhisa Sato Associate Professor Takafumi Fukushima Associate Professor Yuji Ichikawa
Addressing leading-edge academic research in the major area, this course comprises seminars on a subject which students have chosen themselves as well as training in and beyond the university. Integrating these advanced specialist knowledge helps to develop students' problem-posing ability.	By introducing and discussing key research papers in relation to their masters thesis, as well as the background to and interim results of their own research. Through this seminar, students will identify research trends in their particular area and the position of their own research.

Numerical Analysis 2 credits	Probability Models 2 credits
Elective Required	Elective Required
Professor Naofumi Ohnishi	Associate Professor Reika Fukuizumi
Students will be taught the numerical analysis techniques which provide the basis for analysis in fluid dynamics, thermodynamics, mechanics, electromagnetics and measurement and control engineering, etc., and learn how to apply these skills. Classes will focus in particular on (1) numerical solutions for ordinary differential equations (2) the finite difference method and the finite element method for partial differential equations, and (3) linear algebra and numerical optimization methods, covering the basics of numerical analysis and their engineering applications.	Mathematical analysis is important for the understanding of random phenomenon appearing in various fields of natural, life and social sciences, and the probabilistic approach is essential. We start with fundamental concepts in probability theory and learn basic tools for probabilistic models. In particular, for the time evolution of random phenomenon we study basic properties of random walks, Markov chains, Markov processes, and take a bird's eye view of their wide applications. These lectures will be in Japanese in principle and an English resume will be distributed.
Fluid Dynamics 2 credits	Solid Mechanics 2 credits
Elective Required Professor Masaya Shigeta	Elective Required Associate Professor Yoshiteru Aoyagi
Students acquire the intuition and knowledge of the nature of fluid motion by studying the fundamentals of Fluid Dynamics with not only theories but also visualized images, observation videos, and computer graphic animations. The goal is for students to be able to predict the fluid motion and to design the control methods in aerodynamic and material processing applications. Keywords: Vortex, Convection, Stream/Path/Streak lines, Incompressibility/Compressibility, Conservation laws, Bernoulli's theorem, Viscosity and diffusivity, Boundary layer, Aerodynamic force, Laws of similarity, Reynolds number, Strouhal number and Kármán's vortex street, Analogy with heat and mass transfers, Navier-Stokes and wave equations.	This class is designed to provide students with a comprehensive understanding of deformation of solids and covers the fundamentals of continuum solid mechanics. It focuses on two- dimensional elasticity in infinitesimal strain theory, the concept of strain and stress, and the introduction of general methods of solving the boundary value problems through the specific problems. Moreover, this class also covers the fundamentals of finite deformation theory, which is used for addressing the large deformations of solids.
Thermal Science and Engineering A 2 credits	Thermal Science and Engineering B 2 credits
Elective Required Professor Hideaki Kobayashi Professor Kaoru Maruta Professor Takashi Tokumasu Associate Professor Hisashi Nakamura In this course, students will master the basic physics of reactive flows in thermal fluid science. In particular, the course is designed to cover flame behaviors and peculiar phenomena in laminar and turbulent combustion, the basic concept of chemical kinetics and the understanding of reaction phenomena of electrochemistry on the standpoint of thermal science. Through the class, students will further deepen their understanding of the essence of thermal phenomena and will become able to apply this to practical devices.	Elective Required Professor Taku Ohara Professor Tetsushi Biwa Professor Atsuki Komiya Associate Professor Gota Kikugawa The students will master the basic physics of thermal energy conversion and heat transfer in both micro and macroscopic scales, and learn to link this knowledge to engineering applications. More specifically, the series lectures: i) the Molecular Dynamics and molecular scale analyses of thermo- fluid phenomena, ii) oscillating flow based heat transfer and energy conversion, iii) visualization and control of multi-scale heat and mass transfer, and iv) statistical mechanics regarding interface phenomena will be done. Students are expected to further deepen their understanding of the essence of thermal phenomena.
System Control Engineering I 2 credits	System Control Engineering II 2 credits
Elective Required Professor Koichi Hashimoto Professor Yasuhisa Hirata	Elective Required Professor Kazuya Yoshida Associate Professor Yusuke Tamura
New mechanical systems using advanced mechanisms are being developed in a range of areas for medical care and welfare, space exploration, disaster rescue purposes and so on. This course focuses on motion control design of increasingly advanced and complex mechanical systems. Students will learn fundamentals for non-linear system analysis and control system design methods. First, phase plane analysis methods and Lyapunov methods are introduced as the main ways to analyze non-linear systems. Next, non-linear feedback control system design methods that can be used for mechanical control systems with non-linear dynamics. Finally, students look at several control system design methods. This class includes some exercises using MATLAB.	This course gives an advanced lecture based on the contents of "System Control Engineering I." This lecture introduces the analysis and design methods of control systems used for designing motion control for increasingly advanced and complex mechanical systems. Students will learn fundamental concepts for state and output feedback in the state space, state observer and Kalman filter, and response analysis of control systems. This class includes some exercises using MATLAB.

Continuum Mechanics 2 credits	Applied Fluid Mechanics 2 credits
Elective Required Professor Takuji Ishikawa	Elective Required Professor Jun Ishimoto Professor Yuka Iga
Materials may be regarded as continuum at the macroscopic scale. In this lecture, we aim to mathematically understand the motion and deformation of materials, such as solid and fluid, at the macroscopic scale. We first explain the concepts of continuum and stress as well as vector/tensor analysis. We then derive basic equations describing the motion and deformation of continuum, such as equilibrium equation, constitutive equation and boundary conditions. This lecture is the basis of solid and fluid mechanics, which is recommended to students who want to establish a whole picture of both subjects.	This lecture will be given on the fundamentals and applications of multiphase fluid dynamics and numerical analysis related to the fluid dynamic phenomena with heterogeneous interfaces, gas-liquid two-phase flow, phase change, cavitation, and the fundamentals of turbo-type fluid machinery such as pumps and turbines. The main topics to be understand are as follows. 1) Flow pattern and classification method of gas-liquid two-phase flow, 2) Fundamentals of two-fluid model, 3) Modeling of dispersed multi-phase flow and numerical analysis, 4) Modeling of liquid atomization 5) Classification and role of fluid machinery 6) Generation of cavitation in pumps.
Structural Mechanics 2 credits Elective Required	Optical Metrology 2 credits Elective Required
Professor Kanjuro Makihara	Professor Wei Gao Associate Professor Hiraku Matsukuma
This lecture gives a fundamental knowledge on the structural analysis and the structural design of mechanical structures. Main topics of this lecture are deformation and stress analyses of fuselage and wing structures subjected to bending, twisting and shear. (1) Fundamental of mechanical structure and material strength. (2) Vibration analysis for structures. (3) Applied load and stress analysis of mechanical structures. (4) Structural identification and structural health monitoring (5) Structural mechanics for aerospace engineering.	This course focuses on measurement methods and systems with nanometer resolution and accuracy for ultra-precision production, including measurement of displacement and vibrations, surface profiles, geometric forms and motions of precision machines. Fundamental theories and applications of sensor technologies, such as laser interferometer, linear encoder, laser displacement sensor, optical fiber sensor, as well as those of measuring instruments, such as scanning electron microscope, interference microscope, scanning probe microscope, mechanical stylus profiler will be learned through presentations and discussions.
Sensing and Evaluation of Materials System 2 credits	Ultraprecision Machining 2 credits
Elective Required Professor Hitoshi Soyama Professor Hironori Tohmyoh	Elective Required Associate Professor Masayoshi Mizutani
Advanced materials system composed of the variety of materials produces various functions. To operate such a materials system without failure for realizing a safe society, comprehensive understanding of the system, which requires trials not tied to conventional methodologies, is indispensable. In this course, in addition to the error theory, which is the basis of measurement, and the inverse problem analysis for identifying the physical quantities, the evaluation of residual strain, which exists in various devices and structures, is treated. Moreover, the methods for evaluating cracks or material degradation in advanced materials system having various scales from electronic devices to various plants are lectured.	Focusing on description of the principles, technologies and applications achieving both the ultra-precise form accuracy and ultra-smooth surface roughness. The purpose of this course, especially, is to deepen understanding of Ultra-precision machining technology focusing on micro-mechanical machining, non-conventional processing or additive manufacturing.
Nano/Micro Mechanoptics 2 credits	Nano/Micro Tribology 2 credits
Elective Required Professor Yoshiaki Kanamori	Elective Required Professor Koshi Adachi
Mechanoptics is the fusional research field of optics and mechanics. Nano/Micro mechanoptics is a research field of mechanoptics on nano/micrometer scales. Fundamental technologies and applications in the field are surveyed. The topics on micrometer scale are spatial modulators for displays, micromechanical systems for optical telecommunication, optical sensors, etc. The topics on nanometer scale are wavelength- selective optical filters using subwavelength mechanical structures, optical devices for controlling surface optical reflectance and light polarization, and structural optics smaller than the subwavelength optics. Micro/Nanometer scale fabrication technologies for micro/nano mechanoptics are also studied. The latest papers relating to the above are also presented and discussed.	Many contact interfaces exist in one machine or device, and they have strong effects on the performance of the machine or device. Performance of machines and devices are sometimes limited by such contact interfaces. Microscopic design of contact interfaces becomes important and necessary as the size of a machine or device becomes smaller or thinner together with higher performance and accuracy. Principal properties of surfaces and contact interfaces will be explained in this lecture for such needs, and fundamentals and applications of friction and wear will be introduced.

Strength and Reliability of Advanced Materials and Devices 2 credits	Green Nanotechnology 2 credits
Elective Required Professor Hideo Miura	Elective Required Professor Seiji Samukawa
The Strain induced changes of physical and chemical properties of various materials are discussed from the view point of the order of atom arrangenment in the strained materials. The change of the free energy of materials due to strain energy causes the variation or fluctuation of various physical and chemical properties of the strained materials. Since nanotechnology enables us to create very complicated fine structures, large local strain occurs in the structures during manufacturing and operation because of lattice mismatch between nearby materials and higher density of the concentrated fields of strain and mechanical stress. The large local strain and stress accelerate the anisotropic diffusion of component elements, and thus, cause the change of micro texture of the materilas. Therefore, deep understanding of the mechanism of the changes of variou sproperties of materials help us to evaluate the damage of the strained structures and devices and to design the optimum structures and their manufacturing methods. Some examples of fracture and/or failure mechanisms of products are also introduced based on the actual experience of the lecturer. Hideo Miura:hmiura@rift.mech.tohoku.ac.jp	Nanofabrication (etching, deposition, and surface modification) of advanced devices such as ULSIs, nanomachines, optical devices, and bio chips are realized by means of reactive plasmas, scanning tunneling microscope (STM) and so on, via interaction between the device material and microscopic particles such as atoms, molecules, ions, radicals, and photons. This lecture will introduce behavior and interaction of such microscopic particles in processes such as reactive plasma, beam, and atom/molecule handling which are basis of advanced technologies. Measurement methods of such interactions will be explained. Examples of advanced green nanodevices and nanoprocesses used in these devices advanced industries will be introduced.
Geo-technical and Energy Engineering 2 credits	Manufacturing Systems 2 credits
Elective Required Professor Takatoshi Ito Professor Hirokazu Moriya Associate Professor Kiyotoshi Sakaguchi	Elective Required Associate Professor Masayoshi Mizutani Adjunct Instructor Makoto Sano Adjunct Instructor Takashi Genma
This course provides an introduction to geomechanics and engineering techniques for exploitation of geo-energy, especially geothermal energy. The class will explore the status and origin of temperature and stress fields in subsurface rocks, hydraulic fracturing techniques used for creating fractures and improving hydraulic properties of rocks, microseismic imaging and event analysis used for determining geometry and characteristics of fractures, and well testing carried out for determining well and reservoir performance.	This class is included two topics. One is focusing on description of the fundamental principles and applications for intelligent CNC machining centers and industrial robots for industrial production. Machining center, Control system of CNC machine, Mechanisms and control for robot, Sensing system for robot, Software and language for robot, CAD/CAM and FMS, ultra- precision machine. The other is focusing on an optical instrument for LSI manufacturing systems. Design and manufacture of optical lenses, Mechanisms and control of AF/AE camera, Microscope and telescope, Laser interferometer measuring instrument, LSI production, Stepper.
Design of Materials System 2 credits	Biosensor Engineering 2 credits
Elective Required Professor Takeshi Yamaguchi	Elective Required Professor Matsuhiko Nishizawa
This course will provide all students with the fundamental knowledge of material design to develop intelligent mechanical systems with high performance. This course will also review the latest knowledge and concept associated with material system design.	Biological molecular systems for transduction of information and energy will be briefly lectured, followed by the lecture of the construction, mechanism, and technical trends on biosensors utilizing bioelements such as enzymes and antibodies. Biointerface engineering for integrating bioelements with the electric devices will also be lectured for educating ability for engineering innovative biosensors for advanced medicines.
Bio-Micromachine Engineering 2 credits	Biofluid Mechanics 2 credits
Elective Required Professor Matsuhiko Nishizawa	Elective Required
Trotessor Matsuniko Mishizawa The progress of Biomicromachine, which is the fusion of biotechnology and micromachine technology, will be fully lectured, assuming their use for advanced medicines. The processing of biocompatible soft materials is important content of this lecture because the fusion of bioelements and the electric devices requires suitable biointerface techniques utilizing smart biomaterials.	Professor Takuji Ishikawa In this lecture, we learn functions of biological flows in terms of fluid mechanics. Flow field at the cellular scale can be regarded as Stokes flow. We learn basic characteristics and mathematical descriptions of Stokes flow. Flow generated by flagella, swimming microorganisms, motions of vesicles and cells are discussed. Rheology of biofluids is explained by introducing various constitutive laws. Flow in a human body, flying birds, swimming fish and fluid mechanics in spots are lectured. We show fluid mechanics can be a strong tool to understand biological functions.

Special Lecture Series on Integrated Biomechanics I	Intelligent Mechanosystem Analysis 2 credits
2 credits Elective Required Professor Makoto Ohta Associate Professor Kenji Kikuchi	Elective Required Associate Professor Kenichi Funamoto
The mechanical function and structure of living organisms will be described in detail from the standpoint of continuum mechanics. In particular, we will establish understanding for future research, such as fluid dynamics of blood flow and airflow, muscles, blood vessels, and cells as soft materials, and static and dynamics of skeletal systems as hard materials. Then, we will explain the measurement and visualization methods of the information from the living body and learn the principles of measurements for biological information and its application. (Note) This course is offered in Japanese and English every other year and is offered in Japanese on 2021.	Intelligent mechano-systems are generally modeled as infinite- dimensional nonlinear dynamical systems. As a basis of modern control theory to deal with such systems, we first study basic concepts of function spaces, dual spaces, and linear operators, and understand basic theories of optimization from intuitive geometrical point of view. Next, mathematical modeling of mechano-systems is discussed for fluid control systems focusing on the relationship between the structure of differential equations and physical phenomena. It is preferable to have basic background on fluid dynamics, control engineering, linear algebra, and analysis.
Nano-and Micro-Surface Metrology and Engineering 2 credits	Physical Fluctuomatics 2 credits
Elective Required Professor Wataru Yashiro	Elective Required Professor Kazuyuki Tanaka
Measurement and control are the two wheels of manufacturing. The aim of this lecture is to learn the history of the development of conventional techniques for measurement and control methods covering a wide range of spatial scales from atomic to macroscopic scales of surfaces and interfaces that govern the function of materials. The ultimate goal of this lecture is to develop the ability to analyze for oneself what the limits of conventional measurement and control techniques are, and what problems have been essentially solved to open up new frontiers.	Applications to many fields in engineering like control, signal processing etc. and in information sciences are in mind through the lecture course for the basic knowledge of statistical machine learning theory as well as stochastic processes. Brief introduction will be given to methods for applications like statistical estimation etc., and to the relationship with statistical-mechanical informatics. We first lecture probability and statistics and their fundamental properties and explain the basic frameworks of Bayesian estimation and maximum likelihood estimation. Particularly, we show EM algorithm as one of familiar computational schemes to realize the maximum likelihood estimation. As one of linear statistical models, we introduce Gaussian graphical model and show the explicit procedure for Bayesian estimation and EM algorithm from observed data. We show some useful probabilistic models which are applicable to probabilistic information processing in the stand point of Bayesian estimation. We mention that some of these models can be regarded as physical models in statistical mechanics. Fundamental structure of belief propagation methods are reviewed as powerful key algorithms to compute some important statistical quantities, for example, averages, variances and covariances. Particularly, we clarify the relationship between belief propagations and some approximate methods in statistical mechanics. As ones of application to probabilistic information processing based on Bayesian estimation and maximum likelihood estimations, we show probabilistic information processing and probabilistic reasoning. Moreover, we review also quantum-mechanical extensions of probabilistic information processing.

Environmental Administration 2 credits	Ethics of Engineering and Life 2 credits
Elective Required Various teachers	Elective Required Professor Tetsutaro Hattori
The Graduate School of Environmental Studies has had a cooperation agreement with Miyagi Prefecture and Sendai City, respectively. In this lecture, students learn about current status and issues related to environmental policies of Miyagi Prefecture and Sendai City (about climate change such as global warming, promotion of waste reduction and recycling including plastic recycling, and environment-related laws) to achieve environmental conservation and sustainable society, and learn about environmental policies and environmental technologies. In addition to lectures, this course can help students acquire practical knowledge and develop their ability to think about how to respond to environmental issues through exercise and facility tour.	We will study wide range of ethical issues including "research ethics", which are important for researchers and engineers. Not only medical science but also engineering is closely related to "life". Applying some engineering technologies to various fields such as medicine and food productions, we undoubtedly face the matter of life and death in humans and other creatures. The intrinsic influence of engineering is huge, which requires us to acquire sophisticated knowledge and learn the ethical norm. We will invite experts engaged in various fields to give lectures. We will also arrange group discussion and presentation.*Note for foreign students: Lectures are given in Japanese. In slides and handouts, some lecturers give titles etc. both in Japanese and English, but others do not.
Internship Training 1 or 2 credits	International Scientific Internship Training 1 or 2 credits
Elective Required All teachers Practical training and research conducted at a company for around one week to one month in the first-year of masters program. Through this training, students learn how to apply the basic research at university to a real industrial technology setting. Additionally, students gain on-site experience and understand the realities of planning, surveys and research, product development, manufacturing and product management, etc., in companies. It is desirable that all students take this training. One or two credits are given to them according to the content and the period of the training.	Elective Required All teachers When students have attended any lectures or practiced in a foreign academic organization or science program, one or two credits are given to them according to the content and the period.
Special Lecture on Finemechanics A 1 or 2 credits	Advanced Seminar on Finemechanics A 1 or 2 credits
Elective Required Various teachers A special lecture on leading-edge academic research in the major area, or on the creation and development of knowledge in relation to the major area.	Elective Required Various teachers Addressing leading-edge academic research in the major area, this course comprises seminars on a subject which students have chosen themselves as well as training in and beyond the university. Integrating these advanced specialist knowledge helps to develop students' problem-posing ability.
Seminar on Materials and Mechanics2 creditsElective RequiredProfessor Hitoshi SoyamaProfessor Hideo MiuraProfessor Hitonori TohmyohProfessor Takeshi YamaguchiAssociate Professor Yoshiteru AoyagiAssociate Professor Ken SuzukiAssociate Professor Yoichi Takeda	Seminar on Nanomechanics2 creditsElective RequiredProfessor Wei GaoProfessor Taku OharaProfessor Takashi TokumasuProfessor Seiji SamukawaProfessor Wataru YashiroAssociate Professor Hiraku MatsukumaAssociate Professor Shigeru YonemuraAssistant Professor Gota Kikugawa
By introducing and discussing key research papers in relation to their masters thesis, as well as the background to and interim results of their own research. Through this seminar, students will identify research trends in their particular area and the position of their own research.	By introducing and discussing key research papers in relation to their masters thesis, as well as the background to and interim results of their own research. Through this seminar, students will identify research trends in their particular area and the position of their own research.

Seminar on Biomechanics 2 credits	Seminar on Intelligent Mechano-Systems 2 credits
Elective Required Professor Matsuhiko Nishizawa Professor Takuji Ishikawa Associate Professor Kenji Kikuchi	Elective Required Professor Makoto Ohta Associate Professor Kenichi Funamoto
By introducing and discussing key research papers in relation to their masters thesis, as well as the background to and interim results of their own research. Through this seminar, students will identify research trends in their particular area and the position of their own research.	By introducing and discussing key research papers in relation to their masters thesis, as well as the background and interim results of their own research. Through this seminar, students will identify research trends in their particular area and the position of their own research.
Master's Thesis Research in Finemechanics 8 credits	
Required Various teachers	
Students engage in experiments and seminars, including research presentations, discussion and literature reviews. Students who have acquired credits from the Innovation Oriented Seminar on Mechanical Engineering program do not need to take this course.

Numerical Analysis 2 credits	Probability Models 2 credits
Elective Required Professor Naofumi Ohnishi	Elective Required Associate Professor Reika Fukuizumi
Students will be taught the numerical analysis techniques which provide the basis for analysis in fluid dynamics, thermodynamics, mechanics, electromagnetics and measurement and control engineering, etc., and learn how to apply these skills. Classes will focus in particular on (1) numerical solutions for ordinary differential equations (2) the finite difference method and the finite element method for partial differential equations, and (3) linear algebra and numerical optimization methods, covering the basics of numerical analysis and their engineering applications.	Mathematical analysis is important for the understanding of random phenomenon appearing in various fields of natural, life and social sciences, and the probabilistic approach is essential. We start with fundamental concepts in probability theory and learn basic tools for probabilistic models. In particular, for the time evolution of random phenomenon we study basic properties of random walks, Markov chains, Markov processes, and take a bird's-eye view of their wide applications. These lectures will be in Japanese in principle and an English resume will be distributed.
Fluid Dynamics 2 credits	Solid Mechanics 2 credits
Elective Required Professor Masaya Shigeta	Elective Required Associate Professor Yoshiteru Aoyagi
Students acquire the intuition and knowledge of the nature of fluid motion by studying the fundamentals of Fluid Dynamics with not only theories but also visualized images, observation videos, and computer graphic animations. The goal is for students to be able to predict the fluid motion and to design the control methods in aerodynamic and material processing applications. Keywords: Vortex, Convection, Stream/Path/Streak lines, Incompressibility/Compressibility, Conservation laws, Bernoulli's theorem, Viscosity and diffusivity, Boundary layer, Aerodynamic force, Laws of similarity, Reynolds number, Strouhal number and Kármán's vortex street, Analogy with heat and mass transfers, Navier-Stokes and wave equations.	This class is designed to provide students with a comprehensive understanding of deformation of solids and covers the fundamentals of continuum solid mechanics. It focuses on two- dimensional elasticity in infinitesimal strain theory, the concept of strain and stress, and the introduction of general methods of solving the boundary value problems through the specific problems. Moreover, this class also covers the fundamentals of finite deformation theory, which is used for addressing the large deformations of solids.
Thermal Science and Engineering A 2 credits	Thermal Science and Engineering B 2 credits
Elective Required Professor Hideaki Kobayashi Professor Kaoru Maruta Professor Takashi Tokumasu Associate Professor Hisashi Nakamura In this course, students will master the basic physics of reactive flows in thermal fluid science. In particular, the course is designed to cover flame behaviors and peculiar phenomena in laminar and turbulent combustion, the basic concept of chemical kinetics and the understanding of reaction phenomena of electrochemistry on the standpoint of thermal science. Through the class, students will further deepen their understanding of	Elective Required Professor Taku Ohara Professor Tetsushi Biwa Professor Atsuki Komiya Associate Professor Gota Kikugawa The students will master the basic physics of thermal energy conversion and heat transfer in both micro and macroscopic scales, and learn to link this knowledge to engineering applications. More specifically, the series lectures: i) the Molecular Dynamics and molecular-scale analyses of thermo- fluid phenomena, ii) oscillating-flow based heat transfer and energy conversion, iii) visualization and control of multi-scale heat and mass transfer, and iv) statistical mechanics regarding interface phenomena will be done. Students are expected to further deepen their understanding of the essence of thermal
	phenomena.
System Control Engineering I 2 credits Elective Required Professor Koichi Hashimoto Professor Yasuhisa Hirata	System Control Engineering II 2 credits Elective Required Professor Kazuya Yoshida Associate Professor Yusuke Tamura
New mechanical systems using advanced mechanisms are being developed in a range of areas for medical care and welfare, space exploration, disaster rescue purposes and so on. This course focuses on motion control design of increasingly advanced and complex mechanical systems. Students will learn fundamentals for non-linear system analysis and control system design methods. First, phase plane analysis methods and Lyapunov methods are introduced as the main ways to analyze non-linear systems. Next, non-linear feedback control system design methods that can be used for mechanical control systems with non-linear dynamics. Finally, students look at several control system design methods. This class includes some exercises using MATLAB.	This course gives an advanced lecture based on the contents of "System Control Engineering I." This lecture introduces the analysis and design methods of control systems used for designing motion control for increasingly advanced and complex mechanical systems. Students will learn fundamental concepts for state and output feedback in the state space, state observer and Kalman filter, and response analysis of control systems. This class includes some exercises using MATLAB.

Continuum Mechanics 2 credits	Applied Fluid Mechanics 2 credits
Elective Required	Elective Required
Professor Takuji Ishikawa	Professor Jun Ishimoto
	Professor Yuka Iga
Materials may be regarded as continuum at the macroscopic scale. In this lecture, we aim to mathematically understand the motion and deformation of materials, such as solid and fluid, at the macroscopic scale. We first explain the concepts of continuum and stress as well as vector/tensor analysis. We then derive basic equations describing the motion and deformation of continuum, such as equilibrium equation, constitutive equation and boundary conditions. This lecture is the basis of solid and fluid mechanics, which is recommended to students who want to establish a whole picture of both subjects. Structural Mechanics 2 credits	This lecture will be given on the fundamentals and applications of multiphase fluid dynamics and numerical analysis related to the fluid dynamic phenomena with heterogeneous interfaces, gas-liquid two-phase flow, phase change, cavitation, and the fundamentals of turbo-type fluid machinery such as pumps and turbines. The main topics to be understand are as follows. 1) Flow pattern and classification method of gas-liquid two-phase flow, 2) Fundamentals of two-fluid model, 3) Modeling of dispersed multi-phase flow and numerical analysis, 4) Modeling of liquid atomization 5) Classification and role of fluid machinery 6) Generation of cavitation in pumps. Micro Electro Mechanical Systems 2 credits
Elective Required	Elective Required
Professor Kanjuro Makihara	Professor Shuji Tanaka Associate Professor Takashiro Tsukamoto
This lecture gives a fundamental knowledge on the structural analysis and the structural design of mechanical structures. Main topics of this lecture are deformation and stress analyses of fuselage and wing structures subjected to bending, twisting and shear. (1) Fundamental of mechanical structure and material strength. (2) Vibration analysis for structures. (3) Applied load and stress analysis of mechanical structures. (4) Structural identification and structural health monitoring (5) Structural mechanics for aerospace engineering.	This course deals with key components and microfabrication technology for bio-mechanodevices, which are used for human interface, advanced robotics, biomedical applications, wireless communication etc. Important key components such as sensors, actuators and packaging are overviewed together with related materials and typical applications. Microfabrication technology is explained in detail. The topics include wet/dry etching, physical/chemical vapor deposition, lithography, diffusion, oxidation, electroplating and wafer bonding. The lecture is given in practical aspects as well as fundamental aspects for who is studying microdevices and a wide range of related technology.
Advanced Robotics 2 credits	Biomechatronics 2 credits
Elective Required	Elective Required
Professor Yasuhisa Hirata	Professor Mami Tanaka
Associate Professor Yusuke Tamura	
The robot is an advanced system that consists of mechanical parts, actuators, sensors, and controllers. By integrating the several systems and control methods effectively, the robot could realize required tasks in the real environment. In this lecture, the fundamental and advanced motion control methods of the robot will be given, and the recent applications developed by the integration of the robot technologies will be introduced.	
Foundations of Molecular Robotics 2 credits	Intelligent Mechanosystem Analysis 2 credits
Elective Required Professor Satoshi Murata Associate Professor Shinichiro Nomura	Elective Required Associate Professor Kenichi Funamoto
Molecular robotics is a technology for creating systems by combining logically designed molecules. The basis of molecular robotics are DNA nanotechnology and artificial cell engineering. DNA nanotechnology is used to create various nanostructures and molecular computers for molecular robot by designing the sequences of nucleic acid molecules such as DNA. Artificial cell engineering is a methodology to embed various functional molecules in vesicles called liposomes to create a cellular molecular robot. In addition, synthetic biology, which is a closely related subject to molecular robotics, will also be explained.	Intelligent mechano-systems are generally modeled as infinite- dimensional nonlinear dynamical systems. As a basis of modern control theory to deal with such systems, we first study basic concepts of function spaces, dual spaces, and linear operators, and understand basic theories of optimization from intuitive geometrical point of view. Next, mathematical modeling of mechano-systems is discussed for fluid control systems focusing on the relationship between the structure of differential equations and physical phenomena. It is preferable to have basic background on fluid dynamics, control engineering, linear algebra, and analysis.

Introduction to Solid State Ionics 2 credits	Human-Robot Informatics 2 credits
Elective Required	Elective Required
Professor Koji Amezawa	Professor Satoshi Tadokoro
Associate Professor Takashi Nakamura	Professor Kazunori Ohno
	Associate Professor Masashi Konyo
	^c
	Associate Professor Kenjiro Tadakuma
In this lecture, ionic transport phenomena in solids will be discussed. Ions in ceramics, ionic crystals, and inorganic glasses can move in varying degrees. Particularly solids showing excellent ionic conduction are called as solid state ionic conductors, and utilized as electrolytes or electrodes of fuel cells, batteries, and electrochemical sensors. In this lecture, basics of solid state ionics, such as mechanisms of ionic conduction in solid, will be first explained, and then advanced applications of solid state ionic conductors will be introduced.	
Fluid Design Informatics 2 credits	Neuro Robotics 2 credit
Elective Required	Elective Required
Professor Shigeru Obayashi	Professor Mitsuhiro Hayashibe
Associate Professor Koji Shimoyama	Associate Professor Dai Owaki
This lecture aims to construct the theories, learn the	This course deals with key elements for Neuro-Robotics which is
methodologies, and see the real-world examples of fluid engineering design, which is based on computational fluid dynamics (CFD) combined with information science. The lecture outline is organized as 1. design optimization, 2. gradient method, 3. evolutionary computation, 4. surrogate model, 5. physics-based optimization, and 6. data mining.	new scientific field to use robotics for neuroscience and use neuroscience for robotics. We learn robotics computation aspect and neuroscience knowledge to understand human functionality with the view of robotics, and robotics modeling and computation technology which is useful to understand human system of motor control and motor learning. It may include machine learning, neural network, Kalman filtering, control methods for computation aspect. The lecture is given in practical aspects as well as fundamental aspects for students who study neurorobotics and its related applications.
Intelligent Control Systems 2 credits	Functional Fluids Engineering 2 credits
Elective Required	Elective Required
Professor Koichi Hashimoto	Professor Takehiko Sato
Associate Professor Shingo Kagami	Professor Masaya Shigeta
	Professor Hidemasa Takana
The aim of this lecture is to obtain the basics knowledge and to	This course covers fluids that express functionality depending by

Advanced Seminar on Robotics A	Seminar on Nano-Systems 2 credits
Elective Required Various teachers	Elective Required Professor Shuji Tanaka Professor Satoshi Murata Professor Yoichi Haga Professor Yoshiaki Kanamori Associate Professor Shinichiro Nomura Associate Professor Takaki Tsukamoto
Addressing leading-edge academic research in the major area, this course comprises seminars on a subject which students have chosen themselves as well as training in and beyond the university. Integrating these advanced specialist knowledge helps to develop students' problem-posing ability. Seminar on Robot-Systems 2 credits	By introducing and discussing key research papers in relation to their masters thesis, as well as the background to and interim results of their own research. Through this seminar, students will identify research trends in their particular area and the position of their own research. Master's Thesis Research in Robotics 8 credits
Elective Required Professor Mami Tanaka Professor Mitsuhiro Hayashibe Professor Yasuhisa Hirata Associate Professor Takeshi Okuyama Associate Professor Dai Owaki Associate Professor Yusuke Tamura	Required Various teachers
By introducing and discussing key research papers in relation to their masters thesis, as well as the background to and interim results of their own research. Through this seminar, students will identify research trends in their particular area and the position of their own research.	Students engage in experiments and seminars, including research presentations, discussion and literature reviews. Students who have acquired credits from the Innovation Oriented Seminar on Mechanical Engineering program do not need to take this course.

Numerical Analysis 2 credits	Probability Models 2 credits
-	
Elective Required Professor Naofumi Ohnishi	Elective Required Associate Professor Reika Fukuizumi
Students will be taught the numerical analysis techniques which provide the basis for analysis in fluid dynamics, thermodynamics, mechanics, electromagnetics and measurement and control engineering, etc., and learn how to apply these skills. Classes will focus in particular on (1) numerical solutions for ordinary differential equations (2) the finite difference method and the finite element method for partial differential equations, and (3) linear algebra and numerical optimization methods, covering the basics of numerical analysis and their engineering applications. Fluid Dynamics Elective Required Professor Masaya Shigeta Students acquire the intuition and knowledge of the nature of fluid motion by studying the fundamentals of Fluid Dynamics with not only theories but also visualized images, observation videos, and computer graphic animations. The goal is for students to be able to predict the fluid motion and to design the control methods in aerodynamic and material processing applications. Keywords: Vortex, Convection, Stream/Path/Streak lines, Incompressibility/Compressibility, Conservation laws, Bernoulli's theorem, Viscosity and diffusivity, Boundary layer, Aoradmenic force Lows of cimilority. Roundary layer,	Mathematical analysis is important for the understanding of random phenomenon appearing in various fields of natural, life and social sciences, and the probabilistic approach is essential. We start with fundamental concepts in probability theory and learn basic tools for probabilistic models. In particular, for the time evolution of random phenomenon we study basic properties of random walks, Markov chains, Markov processes, and take a bird's-eye view of their wide applications. These lectures will be in Japanese in principle and an English resume will be distributed. Solid Mechanics 2 credits Elective Required Associate Professor Yoshiteru Aoyagi This class is designed to provide students with a comprehensive understanding of deformation of solids and covers the fundamentals of continuum solid mechanics. It focuses on two- dimensional elasticity in infinitesimal strain theory, the concept of strain and stress, and the introduction of general methods of solving the boundary value problems through the specific problems. Moreover, this class also covers the fundamentals of finite deformation theory, which is used for addressing the large deformations of solids.
Aerodynamic force, Laws of similarity, Reynolds number,	
Strouhal number and Kármán's vortex street, Analogy with heat and mass transfers, Navier-Stokes and wave equations.	
Thermal Science and Engineering A 2 credits	Thermal Science and Engineering B 2 credits
Elective Required Professor Hideaki Kobayashi Professor Kaoru Maruta Professor Takashi Tokumasu Associate Professor Hisashi Nakamura In this course, students will master the basic physics of reactive flows in thermal fluid science. In particular, the course is designed to cover flame behaviors and peculiar phenomena in laminar and turbulent combustion, the basic concept of chemical kinetics and the understanding of reaction phenomena of electrochemistry on the standpoint of thermal science. Through the class, students will further deepen their understanding of the essence of thermal phenomena and will become able to apply this to practical devices.	Elective Required Professor Taku Ohara Professor Taku Ohara Professor Tetsushi Biwa Professor Atsuki Komiya Associate Professor Gota Kikugawa The students will master the basic physics of thermal energy conversion and heat transfer in both micro and macroscopic scales, and learn to link this knowledge to engineering applications. More specifically, the series lectures: i) the Molecular Dynamics and molecular-scale analyses of thermo- fluid phenomena, ii) oscillating-flow based heat transfer and energy conversion, iii) visualization and control of multi-scale heat and mass transfer, and iv) statistical mechanics regarding interface phenomena will be done. Students are expected to further deepen their understanding of the essence of thermal phenomena.
System Control Engineering I 2 credits	System Control Engineering II 2 credits
Elective Required	Elective Required
Professor Koichi Hashimoto Professor Yasuhisa Hirata	Professor Kazuya Yoshida Associate Professor Yusuke Tamura
New mechanical systems using advanced mechanisms are being developed in a range of areas for medical care and welfare, space exploration, disaster rescue purposes and so on. This course focuses on motion control design of increasingly advanced and complex mechanical systems. Students will learn fundamentals for non-linear system analysis and control system design methods. First, phase plane analysis methods and Lyapunov methods are introduced as the main ways to analyze non-linear systems. Next, non-linear feedback control system design methods that can be used for mechanical control systems with non-linear dynamics. Finally, students look at several control system design methods. This class includes some exercises using MATLAB.	This course gives an advanced lecture based on the contents of "System Control Engineering I." This lecture introduces the analysis and design methods of control systems used for designing motion control for increasingly advanced and complex mechanical systems. Students will learn fundamental concepts for state and output feedback in the state space, state observer and Kalman filter, and response analysis of control systems. This class includes some exercises using MATLAB.

Materials Of antistan	Ormanden Handmann Bundemandele Oracity

of bioengineering. Particular emphasis will be placed on the	approaches to the problems of computer vision, where the main focus is on the recently developed deep learning methods.
basic knowledge and approaches necessary for deep exploration of the anatomy and physiology of the human body from the	focus is on the recently developed deep learning methods.
perspective of biomechanics.	
Digital Signal Processing 2 credits	Introduction to Classical Mechanics and Physical Mathematics 2 credits
Floating Populad	
Elective Required Associate Professor Shingo Kagami	Elective Required Professor Tomonaga Okabe
Associate Professor Toshinori Kuwahara	Torossor Tomonaga Onauc
	Γ 1 1 1 0 1 1 1 1 . Δ
This lecture covers fundamentals of digital signal processing	In the modeling of classical mechanics, we often meet the
that provides a foundation for sensing, control, communication, voice processing, image processing, and so forth. Related subjects	applied mathematics, such as differential geometry or manifolds theory. These have been developed from the viewpoint of
include discrete-time signals, discrete-time and discrete Fourier	mathematical universality and do not always provide new ideas
transformations, sampling, digital frequency analysis, discrete-	directly. But, we often need such a background to make the
time systems, z transformation, digital filtering, and some more	theoretical models. Furthermore, symbols and calculations
advanced topics.	developed in these fields are not commonly used by general
	engineering students or graduate students of engineering, and
	this is considered to be an obstacle for learning them. In this lecture, I am going to introduce those mathematical expressions
	as simple as possible, so that the students can employ the
	advanced mathematics in the general mechanical engineering
	field. This course can also be considered as an introduction to the
	tools of physical mathematics.

Continuum Mechanics 2 credits	Applied Fluid Mechanics 2 credits
Elective Required Professor Takuji Ishikawa	Elective Required Professor Jun Ishimoto Professor Yuka Iga
Materials may be regarded as continuum at the macroscopic scale. In this lecture, we aim to mathematically understand the motion and deformation of materials, such as solid and fluid, at the macroscopic scale. We first explain the concepts of continuum and stress as well as vector/tensor analysis. We then derive basic equations describing the motion and deformation of continuum, such as equilibrium equation, constitutive equation and boundary conditions. This lecture is the basis of solid and fluid mechanics, which is recommended to students who want to establish a whole picture of both subjects.	This lecture will be given on the fundamentals and applications of multiphase fluid dynamics and numerical analysis related to the fluid dynamic phenomena with heterogeneous interfaces, gas-liquid two-phase flow, phase change, cavitation, and the fundamentals of turbo-type fluid machinery such as pumps and turbines. The main topics to be understand are as follows. 1) Flow pattern and classification method of gas-liquid two-phase flow, 2) Fundamentals of two-fluid model, 3) Modeling of dispersed multi-phase flow and numerical analysis, 4) Modeling of liquid atomization 5) Classification and role of fluid machinery 6) Generation of cavitation in pumps.
Structural Mechanics 2 credits	Aerospace Systems 2 credits
Elective Required Professor Kanjuro Makihara	Elective Required Professor Naofumi Ohnishi Adjunct Instructor Koichi Yonemoto Adjunct Instructor Toshihiko Nakagawa Adjunct Instructor Soichiro Yada
This lecture gives a fundamental knowledge on the structural analysis and the structural design of mechanical structures. Main topics of this lecture are deformation and stress analyses of fuselage and wing structures subjected to bending, twisting and shear. (1) Fundamental of mechanical structure and material strength. (2) Vibration analysis for structures. (3) Applied load and stress analysis of mechanical structures. (4) Structural identification and structural health monitoring (5) Structural mechanics for aerospace engineering.	Lectures give the system concept of aircraft and rocket, and discuss the basic design planning and the performance of these flight vhicles.
Aerospace Propulsion 2 credits	Computational Fluid Dynamics 2 credits
Elective Required Professor Naofumi Ohnishi Associate Professor Masayuki Takahashi	Elective Required Professor Soshi Kawai
Lectures on principles of thrust generation of jet engine and rocket engine which propel vehicles in air and space are given, including structure of the engines and methods for improving their performance. Non-chemical propropulsion schemes are also introduced, including physics of plasma.	In this course, the basics of modern computational fluid dynamics (CFD) methods for compressible flow simulations and programming of numerical methods are given. Accuracy and errors of finite difference methods, the meaning of central and upwind schemes, finite volume methods (conservation law and numerical flux), and recent high-order accurate numerical methods are given. Also, we will provide lectures on the programming of numerical methods discussed in this course.
Aerospace Fluid Dynamics 2 credits	Robotics for Space Exploration 2 credits
Elective Required Associate Professor Taku Nonomura	Elective Required Professor Kazuya Yoshida
Associate Professor Taku Rohomura The accurate knowledge and comprehension for thermo fluid dynamics are required to understand the extreme flow phenomena in the aerospace engineering field and to design aircraft and spacecraft. In this course, from the viewpoint of experimental aerodynamics, 1)various experimental techniques in aerospace engineering fields such as wind-tunnel experiments are lectured with introducing latest examples, and 2)flow control techniques and applications for advanced aircraft and spacecraft are discussed.	Robotics technology is useful for space development and exploration activities. In this course, the subject of Space Robotics is elaborated on the application to orbital servicing missions and lunar/planetary exploration. As for the "orbital robotics," the following topics are lectured: - Angular motion kinematics and attitude dynamics of a spacecraft, - Multi-body dynamics and control of a free-flying space robot, - Impact dynamics and post-impact control when a space robot captures a floating target. As for the "lunar/planetary robotics," the following topics are lectured: - Mission and system design for Lunar and asteroid exploration, - Mobility system design and analysis for locomotion on the lunar/planetary surface, - Sensing, planning, and navigation of a mobile robot. All lectures are given in English.

Spacecraft Engineering 2 credits	Mathematical Modeling and Computation 2 credits
Elective Required	Elective Required
Professor Kazuya Yoshida Professor Kanjuro Makihara Professor Hiroki Nagai Associate Professor Toshinori Kuwahara	Professor Satoru Yamamoto
 In this course, the fundamental engineering issues are lectured in the following four parts for the design and development of spacecraft and space flight systems. (1) Orbital mechanics for various space missions (2) Attitude dynamics and control of spacecraft (3) Design of space structures, vibration analysis and control (4) Thermodynamics and thermal control of space systems All lectures are given in English. 	This lecture introduces typical mathematical models on some physical and social problems observed in nature and in events which are basically formulated by a system of nonlinear partial- differential equations, and also teaches the numerical methods based on the finite difference method for solving the mathematical models. Each student is subjected to make his own mathematical model and submits the computational result as the final report.
Applied Mathematical Fluid Dynamics 2 credits	High Performance Computing 2 credits
Elective Required Professor Yuji Hattori Associate Professor Makoto Hirota	Elective Required Professor Hiroyuki Takizawa
A number of ideas in applied mathematics, which include dynamical systems, differential geometry, Lie groups, and statistical mechanics, have been applied to fluid dynamics. Recent development in basic fluid dynamics is introduced and methods and ideas for attacking various problems in nonlinear dynamics are given. The lecture consists of three parts: (i) theory of hydrodynamics stability, (ii) statistical fluid dynamics, and (iii) topological fluid dynamics.	This course reviews high-performance computing systems from both aspects of hardware and software. The course talks about the importance of parallel processing, parallel system architectures, parallel algorithm design, parallel programming, and performance evaluation methodologies. The course also discusses the memory systems necessary for high-performance computing.
Fluid Design Informatics 2 credits	Computer Architecture 2 credits
Elective Required Professor Shigeru Obayashi Associate Professor Koji Shimoyama	Elective Required Professor Hiroaki Kobayashi Assosiate Professor Masayuki Sato
This lecture aims to construct the theories, learn the methodologies, and see the real-world examples of fluid engineering design, which is based on computational fluid dynamics (CFD) combined with information science. The outline of this lecture is organized as 1. design optimization, 2. gradient method, 3. evolutionary computation, 4. surrogate model, 5. physics-based optimization, 6. data mining, and 7. real-world applications.	The term "computer architecture" means the concept of designing computers and is also its philosophy. This course begins with the basic principles of computers, and then talks about instruction-level parallel processing, vector processing, parallel computing systems, and their control mechanisms. Supercomputing techniques such as vector systems and accelerators are also reviewed. See the class web page for more details. http://www.sc.isc.tohoku.ac.jp/class/architecture/ (Contact instructors to have an access ID).
Physical Fluctuomatics 2 credits	Environmental Administration 2 credits
Elective Required Professor Kazuyuki Tanaka	Elective Required Various teachers
Applications to many fields in engineering like control, signal processing etc. and in information sciences are in mind through the lecture course for the basic knowledge of statistical machine learning theory as well as stochastic processes. Brief introduction will be given to methods for applications like statistical estimation etc., and to the relationship with statistical-mechanical informatics. We first lecture probability and statistics and their fundamental properties and explain the basic frameworks of Bayesian estimation and maximum likelihood estimation. Particularly, we show EM algorithm as one of familiar computational schemes to realize the maximum likelihood estimation. As one of linear statistical models, we introduce Gaussian graphical model and show the explicit procedure for Bayesian estimation and EM algorithm from observed data. We show some useful probabilistic models which are applicable to probabilistic information processing in the stand point of Bayesian estimation. We mention that some of these models can be regarded as physical models in statistical mechanics. Fundamental structure of belief propagation methods are reviewed as powerful key algorithms to compute some important statistical quantities, for example, averages, variances and covariances. Particularly, we clarify the relationship between belief propagations and some approximate methods in statistical mechanics. As ones of application to probabilistic information processing based on Bayesian estimation and maximum likelihood estimations, we show probabilistic information processing and probabilistic reasoning. Moreover, we review also quantum-mechanical extensions of probabilistic information processing.	The Graduate School of Environmental Studies has had a cooperation agreement with Miyagi Prefecture and Sendai City, respectively. In this lecture, students learn about current status and issues related to environmental policies of Miyagi Prefecture and Sendai City (about climate change such as global warming, promotion of waste reduction and recycling including plastic recycling, and environment-related laws) to achieve environmental conservation and sustainable society, and learn about environmental policies and environmental technologies. In addition to lectures, this course can help students acquire practical knowledge and develop their ability to think about how to respond to environmental issues through exercise and facility tour.

Ethics of Engineering and Life 2 credits	Special Lecture in Cooperation with JAXA 2 credits
Elective Required Professor Tetsutaro Hattori	Elective Required Visiting Professor Sadatake Tomioka Visiting Professor Hideyuki Tanno
We will study wide range of ethical issues including "research ethics", which are important for researchers and engineers. Not only medical science but also engineering is closely related to "life". Applying some engineering technologies to various fields such as medicine and food productions, we undoubtedly face the matter of life and death in humans and other creatures. The intrinsic influence of engineering is huge, which requires us to acquire sophisticated knowledge and learn the ethical norm. We will invite experts engaged in various fields to give lectures. We will also arrange group discussion and presentation. *Note for foreign students: Lectures are given in Japanese. In slides and handouts, some lecturers give titles etc. both in Japanese and English, but others do not.	Visiting teachers from JAXA (Japan Aerospace Exploration Agency) make special lecture on future space transportation system. Major topics are system and components of liquid rocket engines, hypersonic air-breathing engines including combined cycle engine, as well as hypersonic aerodynamics for both hypersonic flight and re-entry.
Internship Training1 or 2 creditsElective RequiredAll teachersPractical training and research conducted at a company for around one week to one month in the first-year of masters program. Through this training, students learn how to apply the basic research at university to a real industrial technology setting. Additionally, students gain on-site experience and understand the realities of planning, surveys and research, product development, manufacturing and product management, etc., in companies. It is desirable that all students take this training. One or two credits are given to them according to the content and the period of the training.	International Scientific Internship Training 1 or 2 credits Elective Required All teachers When students have attended any lectures or practiced in a foreign academic organization or science program, one or two credits are given to them according to the content and the period.
Special Lecture on Aerospace Engineering A 1 or 2 credits Elective Required Various teachers A special lecture on leading-edge academic research in the major area, or on the creation and development of knowledge in relation to the major area.	Advanced Seminar on Aerospace Engineering A 1 or 2 credits Elective Required Various teachers Addressing leading-edge academic research in the major area, this course comprises seminars on a subject which students have chosen themselves as well as training in and beyond the university. Integrating these advanced specialist knowledge helps to develop students' problem-posing ability.
Seminar on Aero Systems2 creditsElective RequiredProfessor Tomonaga OkabeProfessor Shigeru ObyashiProfessor Shigeru ObyashiProfessor Soshi KawaiAssociate Professor Taku NonomuraAssociate Professor Koji ShimoyamaAssociate Professor Go YamamotoAssociate Professor Keiichi ShirasuAssociate Professor Yuichi KuyaBy introducing and discussing key research papers in relation totheir masters thesis, as well as the background to and interimresults of their own research. Through this seminar, students	Seminar on Space Systems 2 credits Elective Required Professor Naofumi Ohnishi Professor Kazuya Yoshida Professor Kazuya Yoshida Professor Kazuya Yoshida Professor Sadatake Tomioka Visiting Professor Sadatake Tomioka Visiting Professor Hideyuki Tanno Associate Professor Toshinori Kuwahara Associate Professor Masayuki Takahashi By introducing and discussing key research papers in relation to their masters thesis, as well as the background to and interim results of their own research. Through this seminar, students
will identify research trends in their particular area and the position of their own research. Master's Thesis Research in Aeronautics and Space Engineering 8 credits Required Various teachers	will identify research trends in their particular area and the position of their own research.
Students engage in experiments and seminars, including research presentations, discussion and literature reviews. Students who have acquired credits from the Innovation Oriented Seminar on Mechanical Engineering program do not need to take this course.

Nuclear Reactor Engineering 2 credits	Safety Engineering of Nuclear Energy Systems
Elective Required Professor Hidetoshi Hashizume Associate Professor Shinji Ebara	2 credits Elective Required Professor Makoto Takahashi Associate Professor Daisuke Karikawa
The objective of this class is to understand the basics and applications of thermal fluids and electromagnetic phenomena in nuclear reactors and to respond to national examination together with system modeling capability from the viewpoint of integrated engineering. The main contents are; 1. Heat transfer related to fuel rods 2. Basic matter about boiling and application 3. Pipe flow and natural convection 4. Structural analysis 5. Thermal-hydraulics in a nuclear reactor plant 6. Modeling of turbulence flow	The design of huge complex system such as nuclear power plant is presented in this lecture with the emphasis on the design for safety,redundant system, defense on depth. The basics of relibility engineering, probabilistic safety accessment and human reliability analysis are also lectured. In the latter half of the lecure, students perform simulation based practical training using PC-based nuclear power plant simulator in order to understand the basic plant behavior and the possible scenarios of severe accidents simulating what happened in the Fukushima Daiichi nuclear power plant accident.
Science and Engineering of Particle Beam 2 credits	Plasma Physics and Fusion Energy 2 credits
Elective Required Professor Shigeo Matsuyama Professor Atsuki Terakawa Professor Manabu Tashiro Associate Professor Yohei Kikuchi Associate Professor Seong-Yun Kim Associate Professor Keitaro Hitomi	Elective Required Professor Kenji Tobita Visiting Associate Professor Akinobu Matsuyama
	The objective of this class is to build an overall understanding of fusion energy. The course will cover plasma physics, fusion engineering, fusion power system and its characteristics. Plasma physics will focus on fundamental understanding on how plasma behaves, how to confine high temperature plasma with magnetic fields, and how to heat the plasma up to 100 million °C for fusion power production. Based on the fundamental physics, the course will address the concept of the fusion power system and fusion- relevant technologies to realize fusion energy, covering superconducting magnet, divertor, plasma heating systems. In the last part of the course, safety, environmental and socioeconomic aspects of fusion power will be presented.
Solid State Physics 2 credits	Materials Chemistry 2 credits
Elective Required Professor Dai Aoki Associate Professor Keitaro Hitomi	Elective Required Professor Yutaka Watanabe Professor Koji Amezawa Professor Eiji Akiyama Associate Professor Yoichi Takeda
This course targets students from mechanical engineering, system engineering and a wide range of other specialized areas. Using Introduction to Solid State Physics (Charles Kittel, Eighth Edition) as the main text, it focuses on the fundamentals of material science. Following the chapter order in this text book, each class will cover the content associated with that chapter. The course aims to provide students from a wide range of areas with an understanding of the basics concept of solid state physics and a broad perspective on the behavior of materials in engineering systems.	Most metals in the earth's atmosphere inevitably change into more thermodynamically stable compounds such as oxides or sulfides. To understand this principle more precisely, students will learn chemical and electro-chemical equilibrium theory, and kinetics theory in relation to corrosion and oxidation of metals. Practical examples will be used to explain the phenomena and theories of wet corrosion and high-temperature oxidation, deepening students' understanding of the chemical and electro- chemical reactions related to macro phenomena of corrosion and oxidation. This course will be offered in English with a lecture and practice style, using English-language materials. A detailed outline of the course will be presented during the first class.

Quantum and Statistical Mechanics 2 credits	Environmental Perspective on the Energy Flow
	2 credits
Elective Required	Elective Required
Professor Yasuyoshi Nagai	Professor Yuichi Niibori
Associate Professor Koji Inoue	Associate Professor Seong-Yun Kim
Associate Professor Takeshi Toyama	Associate Professor Taiji Chida
Associate Professor Kenta Yoshida Associate Professor Keitaro Hitomi	Visiting Professor Masayuki Watanabe
Fundamentals of quantum mechanics and statistical mechanics	The purpose of this class is to understand quantitatively the
will be lectured. The main contents are: 1. General theory of quantum mechanics	relations of primary energies and global environment based on "Energy Flow", which is an national energy balance. Besides,
2. Potential problems	the utility of mass or heat balance is learned in order to find out
3. Approximation methods	what the esseintial issue is through some topics including fossil
4. Identical particles and spin	fuel, global warming, acid rain and radioactive wastes of nuclear
5. Fermi-Dirac and Bose-Einstein statistics	energy. Furthermore, the advanced analytical chemistry
6. Quantization of electromagnetic field 7. Others	regarding natural environment and nuclear energy, the reprocessing of spent fuel, the safety assessment of geological
1. Others	disposal system regarding radioactive wastes, and so on are discussed.
Neutron Devices Engineering 2 credits	Basics for Plant Life Management 2 credits
Elective Required	Elective Required
Professor Shigeo Matsuyama	Professor Yutaka Watanabe
Associate Professor Shinji Ebara	Professor Tetsuya Uchimoto
	Professor Noritaka Yusa Associate Professor Hiroshi Abe

Advanced Practical Nuclear Engineering 1 credit	Concrete for Nuclear Power Plants 2 credits
Elective Required Various teachers	Elective Required
Income nequired various teachers	Professor Makoto Hisada Associate Professor Hiroshi Minagawa
	In this class, students learn the general properties of concrete, required quality of various materials for concrete production and its testing method, production method of concrete, construction method to build concrete structures. This class provides the explanations of the relationship between the properties of the concrete and the properties of the materials used as well as the production and construction method of concrete, to help students understand the fabrication of concrete suitable for the design conditions, for materials selection, mix proportion design, production, construction etc.
General Earthquake Engineering 2 credits	Nuclear Safety Theory and Regulation 2 credits
Elective Required	Elective Required
Professor Shigeki Unjoh	Professor Hidetoshi Hashizume
	A specially appointed professor Seiji Abe A specially appointed professor Eiji Hiraoka
This course provides students with the basic theories on the dynamic behavior of infrastructures subjected to earthquake ground motions and the seismic design methods. The purpose of this course is to help students understand the process of seismic design of structures, including mathematical modeling, earthquake response analysis methods and the performance evaluation of structures as well as the basic knowledge for the seismic design.	
Engineering for Nuclear Decommissioning 2 credits	Physical Fluctuomatics 2 credits
Elective Required	Elective Required
Professor Yutaka Watanabe Professor Yuichi Niibori Professor Makoto Takahashi Specially Appointed Professor Koji Dozaki Visiting Professor Masahiro Yamamoto	Professor Kazuyuki Tanaka
This lecture mainly focuses on the Fukushima Dai-ichi Nuclear Power Station, and provides the necessary theories for the safe decommissioning of nuclear reactors after a severe accident. This lecture focuses on the current status of Fukushima Daiichi NPS, lessons learned from past core disruptive accidents, current status and issues of decommissioning research, various efforts for technological development issues, as well as the current status of academic infrastructure such as the concept of ensuring long-term integrity of steel and RC structures during decommissioning, basics of fuel debris, treatment and disposal, and risk communication.	learning theory as well as stochastic processes. Brief introduction will be given to methods for applications like statistical estimation etc., and to the relationship with statistical-mechanical informatics. We first lecture probability

Environmental Adminisitration 2 credits	Ethics of Engineering and Life 2 credits

Special Lecture on Quantum Energy Engineering A	Advanced Seminar on Quantum Energy Engineering A
1 or 2 credits	1 or 2 credits
Elective Required Various teachers	Elective Required Various teachers
A special lecture on leading-edge academic research in the major area, or on the creation and development of knowledge in relation to the major area.	Addressing leading-edge academic research in the major area, this course comprises seminars on a subject which students have chosen themselves as well as training in and beyond the university. Integrating these advanced specialist knowledge helps to develop students' problem-posing ability.
Seminar on Advanced Nuclear Energy Engineering	Seminar on Safety Engineering of Nuclear Energy Systems
2 credits Elective Required Various teacher	2 credits Elective Required Professor Yutaka Watanabe Professor Yuichi Niibori Professor Makoto Takahashi Professor Noritaka Yusa Associate Professor Daisuke Karikawa Associate Professor Hiroshi Abe Associate Professor Taiji Chida
By introducing and discussing key research papers in relation to their masters thesis, as well as the background to and interim results of their own research. Through this seminar, students will identify research trends in their particular area and the position of their own research.	By introducing and discussing key research papers in relation to their masters thesis, as well as the background to and interim results of their own research. Through this seminar, students will identify research trends in their particular area and the position of their own research.

position of their own research.	position of their own research.
Master's Thesis Research in Quantum Science and Energy Engineering 8 credits	
Required Various teachers	
Students engage in experiments and seminars, including	
research presentations, discussion and literature reviews.	
Students who have acquired credits from the Innovation	
Oriented Seminar on Mechanical Engineering program do not	
need to take this course.	

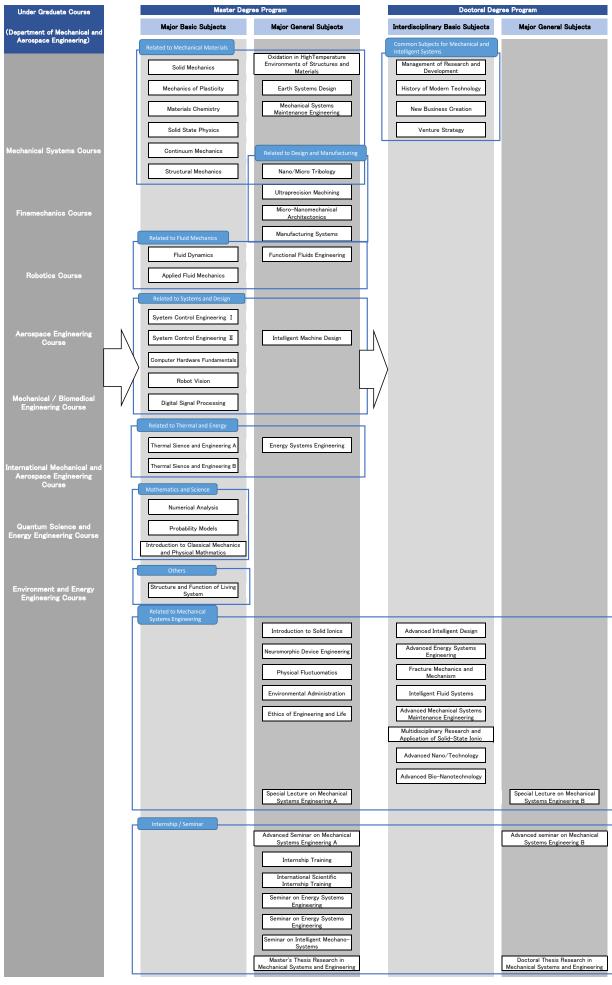

Curriculum Map

A curriculum map is a diagram that systematically summarizes the courses offered by the undergraduate school to the courses offered by the Graduate School of Engineering. Please refer to it when selecting classes.

Classes are related each other, and unless you study them systematically from the basics to the advanced, you will not be able to truly understand and research the field. Please be aware of the connections and linkages between courses, and make a systematic course plan for the field of study you wish to pursue.

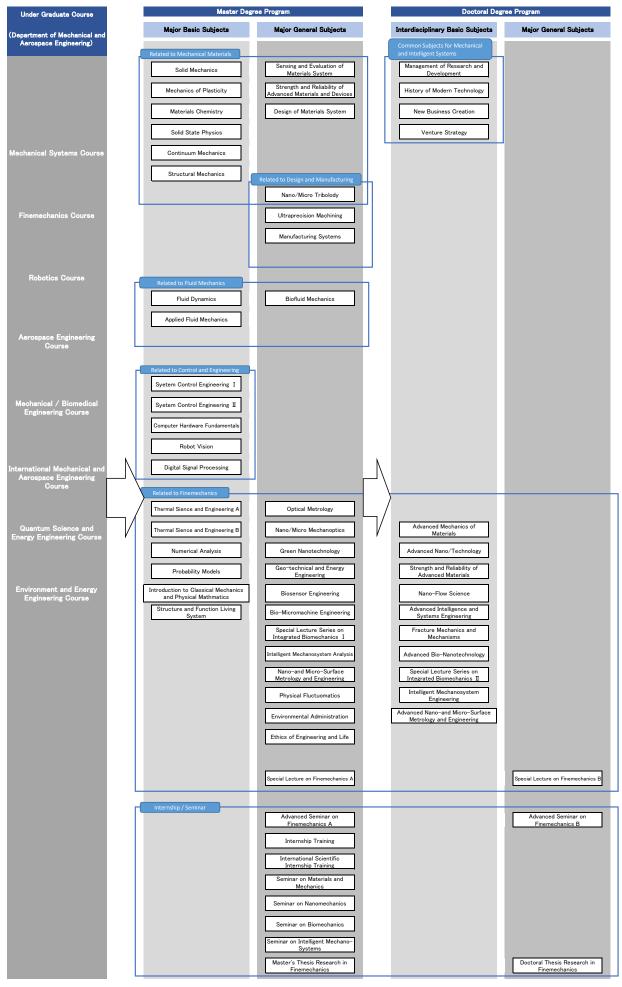

Grades may be written as follows; B1 First year Undergraduate student B2 Second year Undergraduate student B3 Third year Undergraduate student B4 Forth year Undergraduate student

- M1 Master Course first year student
- M2 Master Course second year student
- D1 Doctoral Course first year student
- D2 Doctoral Course second year student
- D3 Doctoral Course third year student

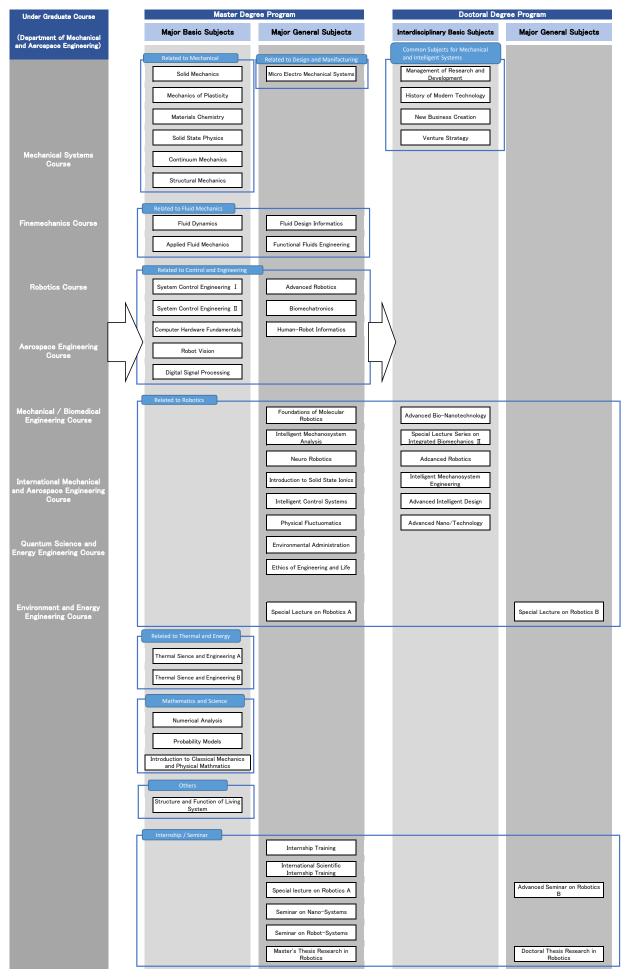

Department of Mechanical Systems Engineering

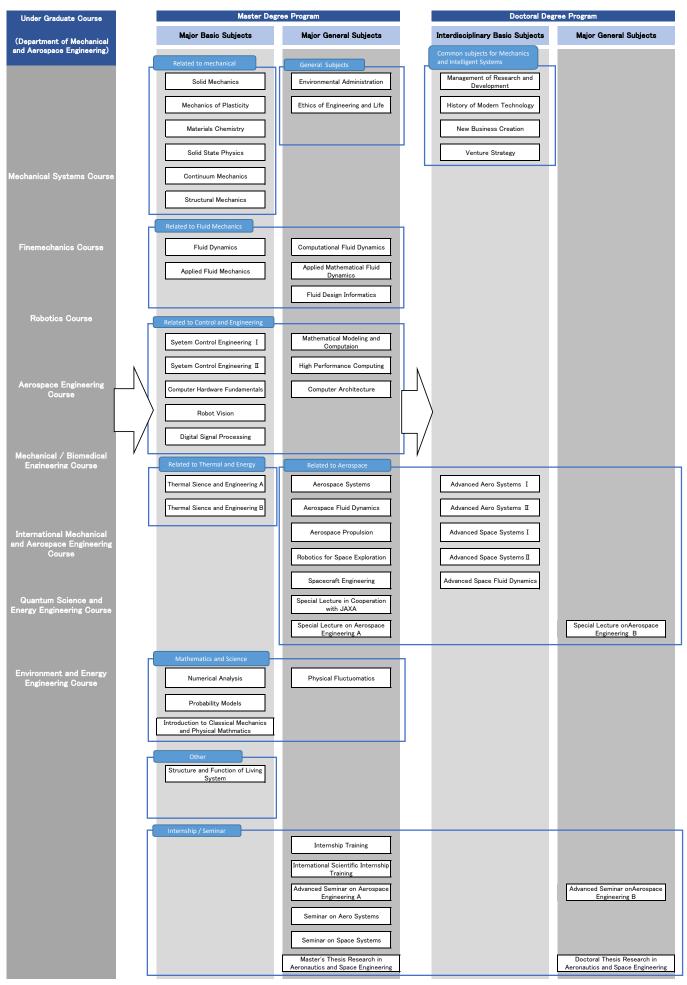

Department of Finemechanics

Department of Robotics

Department of Aerospace Engineering

Department of Quantum Science and Energy Engineering
