8.Specialized Subjects Description

Introduction to Mechanical and Aerospace Engineering

2 Credits Elective
3rd Semester

Mathematics I

2 Credits Elective
3rd Semester

This course teaches the fundamentals of vector calculus, ordinary differential equations, and the Laplace transform which are basic tools to analyze various phenomena in the fields of science and engineering.

Mathematics II

2 Credits Elective
3rd Semester

The course is an introduction to partial differential equations (PDE). This course mainly analyzes initial and boundary value problems for the wave equation and the heat equation. Examples of applications come from physics and complex systems, such as shock waves, traffic flows, and chemical reactions. The course also put a focus on the Fourier series and transforms, as a tool for data processing and solving the PDEs. The goal is to examine concrete examples and develop the general theory.

Numerical Analysis

2 Credits Elective
3rd Semester

Numerical analysis is intended to be an introduction to the basis of linear algebra and numerical analysis. Applications to several engineering issues are included.

1. Vector and metric space
2. Simultaneous equation and its solution
3. Quadratic form and its application
4. Method of least squares
5. Linear programming
6. Basis of game theory

Mechanics

2 Credits Elective
3rd Semester

This lecture is based on the contents on the mechanics already studied in “Physics A” and “Physics B”. “Mechanics” as a specialized subject aims at acquisition of the basic knowledge for applying “Mechanics” to mechanical engineering.
The main contents of this lecture are as follows:
1. Kinetics of a Particle, 2. Kinetics of a System of Particles, 3. Analytic Mechanics, 4. Vibrations of a Particle, 5. Momentum Balance of a Rigid Body, 6. Planar Kinetics of a Rigid Body.

Exercises in Computer-Aided Problem Solving

2 Credits Elective
3rd Semester

This course aims to enable students to acquire skills of solving mathematical problems using computers. In this course, students will use a popular numerical computing software. The focus is not only on learning how to use the software but more on acquiring general mathematical techniques. The course will cover not only subjects in mathematics that students have learned but those they have not learned yet, such as numerical optimization and applied statistics. Specifically, students will learn matrix calculation, linear/nonlinear equations, interpolation, numerical integration, differential equations, Monte Carlo methods, basics of machine learning, etc.

Mechanics of Materials I

2 Credits Elective
4th Semester

This course aims to obtain the basic knowledge of the origin of physical and chemical properties of advanced materials from the view point of the alignment of component elements. In addition, the effect of various atomic scale defects and strain on the properties is discussed. This basic theory is applied to the stable control of not only mechanical properties, but electromagnetic, optical, thermal, and electrochemical properties of various engineering materials.

Fluid Mechanics I

2 Credits Elective
4th Semester

Basic features of fluid motions will be covered. The lecture will focus on the methods to comprehend fluid motions.

1. Physical properties of fluids
2. Static fluid mechanics
3. Basics of fluid motions
4. Momentum theory
5. Dimensional analysis and similarity rule
6. Viscous flow in pipes
7. Flow over immerse bodies

Mechanics of Materials II

2 Credits Elective
4th Semester

This course is intended as an introduction to mechanics of solids offered to engineering students, and presents the underlying theories and formulations for the description of stress/strain and deformations under various types of loading. Mechanics of Materials II discusses the loading mode of bending in addition to tension/compression and torsion treated in Mechanics of Materials I. The topics covered in the course include; (1) theory of beams which allows us to calculate bending/shear stresses in beams and their deflections; (2) energy methods such as Castigliano’s theorem; and (3) compression-induced failure such as buckling.

Quantum Mechanics

2 Credits Elective
4th Semester

The study of quantum mechanics and its applications occupies an important position in modern science. The aim of this course is to give an understanding of the fundamental theories about quantum mechanics. We will learn about historical developments that led to the birth of quantum mechanics, the wave function and the uncertainty principle, Schrödinger equation, bound states in a harmonic oscillator potential, and a hydrogen-like atom.

Mechanical Vibrations I

2 Credits Elective
4th Semester

The focus is on the acquisition of fundamental knowledge regarding dynamic problems which may arise in machinery. Systems with one, two and multiple degrees of freedom with /without damping and/or external force input are specifically discussed. Design of mechanical system based on obtained knowledge is also discussed.

Thermodynamics I

2 Credits Elective
4th Semester

The objectives of this course are to understand basic concepts of thermodynamics and to apply this concept to engineering problems.
Thermodynamics is an important subject strongly related with environmental issues such as energy and global warming due to emission of greenhouse gases. The course includes the basic laws of thermodynamics, processes of ideal gases, conversion cycles between heat and work, phase transition, general relations among quantities of state and exergy (available energy).

Control Engineering I

2 Credits Elective
4th Semester

This course aims to obtain knowledge and understanding of feedback control systems. Starting from Laplace transform and transfer functions of systems, frequency response on Bode and Nyquist diagrams are introduced. Based on these tools, stability of feedback controlled systems is discussed. Stability test with Routh-Hurwits, root locus diagrams and rules for sketching loci are described to characterize system dynamics. Finally, design of feedback controllers with PID, pole assignment and phase lead-lag compensators are presented.

Electromagnetics

2 Credits Elective
5th Semester

Electromagnetics is the base for the development of transducers and also energy conversion machines. It is closely related with research areas of mechanical engineering. The purpose of this lecture is to learn basic knowledge and the way of thinking of electromagnetic field. Fundamentals of Maxwell equations, electro-statics, magneto-statics, and electromagnetic induction will be studied in this lecture. Taking Electromagnetics II is strongly suggested for better understanding of electromagnetics.

Thermodynamics II

2 Credits Elective
7th Semester

This lecture teaches the chemical thermodynamics of aqueous solutions using the first and second laws of thermodynamics. Students will understand the use of thermodynamics related to chemical equilibrium and learn about the calculation of the equilibrium constant based on thermodynamic data. The knowledge of chemical thermodynamics is essential to understand environmental and biological systems and to design sensors, batteries, and medical devices. Through this lecture students learn the basis for the application of chemical thermodynamics to mechanical engineering of the environment, energy and biological systems.

Materials Science I

2 Credits Elective
4th Semester

This course will provide concise introduction to the microstructures and processing of materials and how these are related to the properties of engineering materials. In this case, although we mostly deal with metals, properties of other engineering materials will also be discussed.
The goal of this course is to understand basic properties of materials, how properties are related to microstructures, how microstructures are controlled by processing, and how materials are formed and joined.

Materials Science II

2 Credits Elective
5th Semester

This lecture aims to understand the origin of physical and chemical of materials, which is necessary for the development of highly functional and reliable devices and equipment.
The lecture will focus on the relationship between atomic alignment in materials and various properties such as
1. The origin of materials properties from a viewpoint of atomic alignment
2. Characterization methods of materials
3. Electromagnetic, thermal and optical properties of materials
4. Mechanical properties of materials
5. Electrochemical properties of oxide, ceramics

Computer Seminar I

1 Credits Required
4-5th Semester

This course is designed to introduce undergraduate students to fundamental computer science including text editing and C programming language. The course assumes no prior knowledge about computer systems and computer programming. Students will learn about algorithms and problem solving methods.

Mechanical and Aerospace Engineering Seminar I

2 Credits Required
4th Semester

Students will be divided based on their selected fields of research for this class. Each student will receive instruction on a research topic and then investigate their topic on their own. Students will present their results to the class and discuss them. Through this process students will increase their ability to conduct research individually, learn how to prepare and give presentations, and how to answer questions, in addition to deepening their understanding of their chosen field.

Design and Drawing I

1 Credits Required
5th Semester

To design mechanical systems, several terms such as materials, stiffness and fabrication methods of the mechanical parts should be considered. Mechanical elements such as screws should also be chosen properly to satisfy the required specifications. All the related information will be transferred via drawings, and the preparation of the drawings is called “Mechanical drawings”. Several regulations are strictly determined for the mechanical drawings to correctly transfer the information. In these lectures, students are expected to learn not only how to carry out mechanical drawings but also their regulations throughout several training assignments.

Science Technology and Industry in Japan

1 Credits Elective
4th Semester

This class is a newly developed multidisciplinary course that was organized by the faculties of science, engineering, and agriculture. Except for the first class, each class will feature a talk by a specialist in his/her field. The topic of each talk will be the "past, present, and future of industry, science, and technology, and their relationships and integration in Japan."
Students will obtain fundamental problem-solving abilities, proactiveness, understanding of different cultures, and a multidisciplinary perspective. Registered students are expected to apply what they learn from this course in the newly developed class titled "Multidisciplinary Internship."

Mechanical Vibrations II

2 Credits Elective
5th Semester

The focus is on the acquisition of knowledge regarding dynamic problems which may arise in machinery. Systems with distributed mass and elasticity, rotating machinery, and reciprocating engines are specifically discussed:
1. Vibrations of string, bar, shaft, and beam
2. Dynamics of rotating machinery and reciprocating engines

Manufacturing Engineering and Technology I

2 Credits Elective
5th Semester

Machine systems are made of numerous individual parts and from a variety of materials. Manufacturing is concerned with making the products. This subject teaches basic knowledge of production and manufacturing. Furthermore, the engineering technologies required to realize machine systems are explained.

Fundamentals of Information Science I

2 Credits Elective
5th Semester

In this course, students should be able to:
(1) Know the concept of today's computers based on the history of computer development,
(2) Learn data representation for computers and the mathematical foundation of computer arithmetic, and
(3) Understand the concrete structure and functionality of modern computer systems through their basic components of arithmetic, memory and control units as building blocks in terms of hardware and software.

Electrical and Electronic Circuit I

2 Credits Elective
5th Semester

This course explains the fundamentals of electronic circuits as a linear system and their engineering applications. Topics include:
1) Linear systems and electronic circuits,
2) Resistive circuits,
3) Sinusoidal wave and impedance,
4) AC circuits,
5) Characteristics and response of linear systems,
6) Complex spectrum and frequency domain,
7) System representation.

Manufacturing Engineering and Technology II

2 Credits Elective
5th Semester

Machining is denoted as a series of material-working processes which enable the manufacturing of industrial products having various shapes and functions. In this lecture, the fundamentals of four typical material-removal machining methods, namely, cutting, grinding, polishing and non-traditional machining will be introduced systematically. The emphasis will be placed on new technologies which can improve the accuracy, quality and function of the products.

Electrical and Electronic Circuit II

2 Credits Elective
7th Semester

This course teaches the operations of semiconductor devices and constructing electronic circuits. The fundamentals of analog amplifier circuits for alternating current and digital circuits for logic operations are also studied. Topics include:
1.Semiconductors and diodes
2.Transistors
3.Analog amplifier circuits (small signal low frequency analysis)
4.Digital circuits (logic gates)

Fundamentals of Information Science II

2 Credits Elective
5th Semester

Scientific and engineering simulations using computers require fast and efficient programs. Application programs should also be efficient with respect to speed and memory consumption. In order to make such programs one needs to know some basics of information sciences and some programming techniques. This course provides students with basic knowledge about the following:
(1) Algorithms and data structures.
(2) Model of computation.
(3) Evaluation methods and metrics.

Control Engineering II

2 Credits Elective
7th Semester

Following Control Engineering I, extensive lectures are given on modern control theories. Particularly, a focus is made on the methods for the design and analysis of linear or linearized control systems, based on state-space representation in time domain. The lectures cover the following topics:
1. State equation, state transition matrix, transfer function matrix
2. Controllability and observability
3. Realization, stability
4. State feedback and pole assignment technique
5. Observer, optimal regulator

Fluid Mechanics II

2 Credits Elective
5th Semester

Continuing Fluid Mechanics I, lectures on fluid mechanics are given. The aim is to understand analytical methods for fluid mechanics and their mathematical descriptions through the following topics:
1. Continuity equation and equation of motion
2. Complex velocity potential
3. Potential flows
4. Vortex motions
5. Fundamental concept of exact solution for the Navier-Stokes equations
6. Boundary layer equation
7. Laminar and turbulent flows

Heat Transfer

2 Credits Elective
5th Semester

This class provides explanations of the fundamentals of heat and mass transport phenomena. The aim of this class is to acquire fundamental knowledge of heat and mass transfer, which is useful to several engineering designs. Students firstly study the basic concept of heat transfer including conduction, convection and radiation. Then the applications of the concept to industrial designs, such as heat exchanger, boiler and condenser will be introduced. The goal of this class is to acquire the concept of heat and mass transfer.

Heat and Mass Transfer

2 Credits Elective
8th Semester

Heat and mass transport phenomena are discussed from a broader viewpoint ranging from microscale to macroscale. Thermodynamic quantities are revisited with microscopic descriptions. The basic principles of statistical physics are given in order to understand the relationship between macroscopic thermodynamics and microscopic mechanics. Based on the above basics, the derivation of governing equations for mass transport phenomena, essential analogy between heat transfer and mass transfer, and application cases in the engineering are discussed.

Theory of Elasticity

2 Credits Elective
5th Semester

When an elastic body is subjected to a load, it deforms and stresses are caused. The basis of continuum mechanics called elasticity which treats these phenomena mathematically is explained, where deformation is assumed to be infinitesimal. Contents are as follows: 1.Displacement, strain, equations of compatibility, 2.Stress, equations of equilibrium, 3.Strain energy, theorem of minimum potential energy, 4.Constitutive equations, isotropic body, 5.Navier's equations, Beltrami-Michell compatibility equations, and 6.Analyses of torsion, bending and some 2D problems. This lecture gives the basis of computational mechanics and solid mechanics.

Space Engineering

2 Credits Elective
7th Semester

Basic technologies are taught for the design, development and operation of space systems such as artificial satellites, space stations and space probes. The lectures cover the following topics:
1. History of space development
2. Space environments and space systems
3. Rocket propulsion and Tsiolkovsky's equation
4. Kepler motion and orbital mechanics
5. Attitude dynamics and control of spacecraft
6. Attitude sensors, gyroscopes

Biomechanical Engineering

2 Credits Elective
7th Semester

Cells are the fundamental units of living organisms, and vital phenomena are induced by biochemical reactions in the cells. To understand the morphology and function of living organisms, knowledge of structure, function and evolution of cells is useful. This course aims to give students a basic understanding of the general characteristics of biology and molecular biology on the basis of cells. Biophysical properties of cells and biomechanical properties of tissues are also covered.

Laboratory Experiment I

1 Credits Required
7th Semester

Students will conduct experiments and observations of basic phenomena in the field of mechanical and aerospace engineering, and apply knowledge acquired in lectures to specific examples, in addition to acquiring basic skills needed to conduct specialized experiments. They will learn how to observe and present the results of their experiments. Students will conduct experiments under the guidance of professional instructors and produce and submit reports through discussions with these instructors.

Mechanical and Aerospace Engineering Seminar Ⅱ

1 Credits Required
5-6th Semester

Each student will study and organize documents related to their graduation research theme, and prepare an outline that sums up the documents.
They will also conduct independent research and study based on the documents for presentations and discussions. Through this process they will learn about conducting document-based research, independent research, giving presentations, and responding to questions.

Production Process Practice

1 Credits Required
7th Semester

Each student will study and organize documents related to their graduation research theme, and prepare an outline that sums up the documents.
They will also conduct independent research and study based on the documents for presentations and discussions. Through this process they will learn about conducting document-based research, independent research, giving presentations, and responding to questions.

Computer Seminar II

1 Credits Elective
5th Semester

Each student will study and organize documents related to their graduation research theme, and prepare an outline that sums up the documents.
They will also conduct independent research and study based on the documents for presentations and discussions. Through this process they will learn about conducting document-based research, independent research, giving presentations, and responding to questions.

Multidisciplinary Internship

1 Credits Elective
5th Semester

This class provides an internship or international cultural experience instructed by a supervisor. Student will obtain multilateral problem-solving abilities and practical skills.

Strength and Fracture Materials

2 Credits Elective

6th Semester

Strength and Fracture of Materials offers engineering methodologies for evaluating and ensuring the safety and reliability of machine elements and structures. This provides the academic foundation necessary for machine design in industry. This course covers the following fundamental topics; strength and fracture testing methods, yielding and fracture criteria, fracture mechanics, fracture mechanisms and properties of various materials and their application to machine design. The class then deals with brittle and ductile fractures, fatigue damage, creep deformation and fractures and environmentally assisted cracking. These are typical fracture causes in actual machine elements and structures. The mechanisms and relevant characterizing parameters for the above-mentioned deformation and fractures will be addressed along with methodologies for controlling and preventing them.

Computational Mechanics of Material

2 Credits Elective

6th Semester

According to a revolutionary increase in computer performance, computational mechanics are becoming a powerful way to examine phenomena in place of conventional theoretical and experimental approaches. This course will introduce the basic ideas of computational mechanics with emphasis on finite element methods. The topics are as follows:

1. Role of computational mechanics
2. Finite Difference Method, FDM
3. Finite Element Method, FEM
4. Application of FEM to elastic problem
5. Other approaches, Discrete Element Method

etc.

Computational Fluid Dynamics

2 Credits Elective

8th Semester

The objective of this lecture is to understand numerical methods for solving partial differential equations (PDE) and incompressible Navier-Stokes equations (INSE).

This lecture first introduces the basis of PDE. Second, as typical numerical methods, the basis of finite-difference method (FDM), FDM for PDE, and FDM for INSE are covered.

Compressible Fluid Dynamics

2 Credits Elective

8th Semester

The purpose of this lecture is to understand the basics of compressible fluid dynamics in the inviscid limit. Under the assumption of perfect gas, the basic theories of governing equations for compressible flows, isentropic flows, normal shock waves, oblique shock waves, Prandtl-Meyer expansion waves are given in this lecture. Detailed derivations of the governing equations, isentropic flow relations, and normal/oblique shock relations are also given.

Machine Design I

2 Credits Elective

6th Semester

In machine design, mechanisms, structures, materials and production processes are determined in this order to satisfy specifications and functions required. The selection and design of mechanisms is an upstream process of the machine design, where the basic behavior of the machine is decided. This class is based on mechanisms, which is one of fundamental subjects of mechanical engineering, and gives essential ideas about a basic methodology to topologically analyze mechanisms, the principle and classification of link mechanisms, and the design methods of representative mechanical elements including cam mechanisms, belt drive mechanisms and gear mechanisms.

Machine Design II

2 Credits Elective

8th Semester

Machine design is intellectual work towards finding a method to achieve the purpose of design, and confirm its function. For this reason, designs must be considered from all various factors in wide view, including the fabrication, assembling of mechanical structures and the evaluation of mechanical elements etc. In this lecture, the fundamentals of machine design will be instructed such as: the accuracy, strength, reliability, function and performance of typical mechanical elements.

Robotics I

2 Credits Elective

6th Semester

A robot is a system which is composed of mechanisms, actuators, sensors, and a computer system. The robot senses, thinks and acts as desired by itself based on control algorithms implemented in the computer system. This course introduces basics of modeling and control of a robot. You will learn a brief survey of relevant results from spatial description of a link mechanism, kinematics, inverse kinematics, statics, dynamics.

Robotics II

2 Credits Elective

6th Semester

A robot is a system, which is composed of mechanisms, actuators, sensors, and a computer system. The robot senses, thinks and acts as desired by itself based on algorithms implemented in the computer system. This course introduces basics of configuration space, motion planning, linear and nonlinear control of manipulators and force control. Students attending this course are assumed familiar with “Robotics I”.

Measurement and Instrumentation I

2 Credits Elective

6th Semester

. A wide area of measurement and instrumentation in the field of mechanical engineering will be covered. At first, basic concepts of measurement such as measurement standards, SI units of measurement, traceability, evaluation parameters for a measuring instrument, etc will be introduced. Then sensors based on mechanical, optical, electronic and magnetic principles for measurement of force, pressure, length, distance, displacement, velocity, acceleration, quantity of flow, temperature, etc., will be explained. Finally, signal and data processing, evaluation of measurement results will be presented.

Measurement and Instrumentation II

2 Credits Elective

6th Semester

Following Measurement and Instrumentation I, basic principles and methods of precision measurement as the fundamentals of mechanical engineering will be covered. At first, the concept of precision measurement will be introduced. Then the principles of precision measurement, uncertainty evaluation and measurement standards will be explained, followed by the measurement methods for length and angle, which are the basic quantities of precision measurement. Finally, measuring instruments and technologies for measurement of dimensions, forms, surface roughness, microstructures and internal structures will be presented.

Energy Conversion System Engineering

2 Credits Elective
7th Semester

With focus on electric power supply systems, which are one of the essential energy systems that support modern societies, this lecture aims to learn about energy conversion system engineering from social backgrounds to technical issues. In addition to existing energy conversion systems such as thermal, hydroelectric, nuclear, and geothermal power generations, renewable energies such as solar, wind power generations and fuel cells are included. Energy conversion processes, supply systems, the relationship between energy conversion systems and energy, and environmental problems will be covered.

Aircraft Design

2 Credits Elective
8th Semester

Diverse knowledge in integrated engineering is needed for aircraft design. In this lecture, a basic methodology of aircraft conceptual design is described in conjunction with the basic subjects concerning aircraft such as aerodynamics, structural dynamics, propulsion and control. Topics include:
1. Outline of aircraft
2. Wing and airframe geometry
3. Performance of aircraft

Laboratory Experiment II

1 Credits Required
6th Semester

Under the direct guidance of professional instructors, students will participate in specialized experiments conducted in the Mechanical & Aerospace Engineering course, and observe the environment at each of the research laboratories in various departments. They will see practical examples of knowledge obtained in specialized subjects, providing a basis for their graduation research experiments.

Design and Drawing II

1 Credits Required
7th Semester

Based on the fundamentals learned in Design and Drawing I, students will design several devices in view of architecture, features/performance and strength, and organize the assembly diagrams, detail drawings and design documents while considering manufacturing and assembly methods. The object of the designs will be devices intimately connected with the field of mechanical engineering.

Tribology

2 Credits Elective
7th Semester

Properties of surfaces and contact interfaces in mechanical elements determine the performance and reliability of mechanical systems.
The science of surface, contact, friction and wear caused at the contact interfaces and their control technologies, which are necessary to design an advanced mechanical system, are introduced and explained in this class.

Combustion Engineering

2 Credits Elective
7th Semester

Fundamentals of combustion which is an essential energy conversion process for human society are covered. First, classifications of fuels, relationship between enthalpy of formation of species and flame temperature, and reaction mechanism of combustion are introduced. Then, structures of laminar premixed and non-premixed flames, burning velocity, turbulent flames and detonation are explained. Finally, formation mechanisms of combustion products which have strong environmental impact, as well as the methods to reduce those products, are overviewed.

Introduction to Aerospace Engineering

2 Credits Elective
5th Semester

This lecture introduces basic subjects required for aerospace engineering and its applications. Then specialized topics in the field are briefly explained by each professor belonging to the aerospace course.

Plant Visit

… Credits

Students will deepen their awareness of the connection between academic knowledge of the mechanical and aerospace engineering and society by visiting facilities at various businesses and institutions. They will also observe how mechanical and aerospace engineering functions within actual production processes. These extracurricular field trips are meant to provide students a point of reference for their post-graduation career activities.

Industrial Practice

… Credits Elective

This class aims to provide students with practical knowledge and skills that cannot be obtained through classroom lectures, experiments, and training, and to contribute significantly to the students' subsequent individual studies. The class is held during summer vacation, so students wishing to take it should consult with the course instructor and complete the necessary procedures. At the end of the course, each student will submit a report. If this report is deemed sufficient, the student will receive a number of credits commensurate with the activities performed.

Special Seminar and Practice

… Credits Elective

This course aims to give students the experience of mechanical engineering through practical activities or training. It also includes an internship in one of many Japanese companies.

Special Lectures I ⋯ Credits Elective

Special lectures related to international mechanical and aerospace engineering will be given.

Special Lectures II ⋯ Credits Elective

Special lectures related to international mechanical and aerospace engineering will be given.

Graduation Thesis

6 Credits Required

6-9th Semester

A graduation thesis is a vital component of the requirements for students seeking to graduate. The students will carry out research and write a graduation thesis. Working within the research laboratory they chose at the beginning of their 3rd year, students shall organize their research on a topic proposed by their academic adviser. They shall develop problem-solving abilities through document-based research, experimentation and calculation, in addition to learning how to organize and present the results of their research.

9.Engineering Common Subject Description

Exercises in Mathematics and Physics I

1 Credit Required
2nd Semester

This course aims to bridge the gap between the relevant mathematical knowledge necessary in physics and its late appearance in mathematic courses for the freshmen of the School of Engineering. It emphasizes developing students' abilities of calculating, problem- solving and applying mathematics into physics and specific subjects, so as to help students to progress naturally to college physics and engineering subjects where calculus is the basic language. The course covers: differential, integral, series, partial differentials, multiple integrals, vector calculus, ordinary differential equations, laws of motion, and work and energy.

Exercises in Mathematics and Physics II

1 Credit Required
3rd Semester

This is the continuation of Exercises in Mathematics and Physics I. It emphasizes developing students' abilities of calculating, problem-solving and applying mathematics into physics and specific subjects, so as to help students to progress naturally to college physics and engineering subjects where calculus is the basic language. The course covers: vector integral theorem, high order differential equations, fourier analysis, momentum and angular momentum, vibration, relative motion, mechanics of system of particles, rigid bodies, fluid mechanics, elastic mechanic and waves.

Practice of Information Processing

1 Credit Required
4th Semester

This course aims to help students acquire basic programming skills for information processing. Students will experience writing, compiling, executing programs under the Unix environment to deeply understand the basic grammar of the C programming language. Basic Information B is a prerequisite. Students are recommended to review Basic Information B, particularly the basic grammar of the C programming language and usage of computer systems in the class rooms. To acquire programming skills, it is necessary to write several codes by yourself. So it is important for students to prepare and review this course not only during the class hours but also outside of the hours.

Team-based Engineering for Inovention

1~2 Credits Elective
4.6th Semester

Students will apply their own ideas and creativity to find solutions to assigned or student-created, problems, and study methods and tools for realizing their solutions. This course puts particular emphasis on the process of performing these tasks.
Group study will be performed with advice from the instructor, providing an excellent opportunity for students to experience the pleasures of communication, teamwork, discovery, and creativity. It also provides a chance for students to broaden their knowledge, as they are free to choose problems not related to their field of study. Some topics are jointly implemented with the University of Science and Technology Beijing (China). We hope that many students will take this course.

Engineering Ethics

1 Credits Elective
5-7 Semester

This course aims to provide engineering students with a sense of responsibility and awareness towards society, and an understanding regarding the social and environmental effects and value of engineering solutions.
We hope to teach students that the ultimate goal of engineering is human welfare, but that in fact a lack of ethics in engineering personnel is causing large problems in society and the global environment. Students will study the process of making ethical value judgments using actual case studies related to engineering.

English in Technology I

1 Credits Elective

.

Academic Writing

1 Credits Elective
4th Semester

English in Technology II

1 Credits Elective
7 Semester

This lecture aims at training students' ability of English communication as a scientist and engineer. The focus is the presentation skill, while various relevant aspects such as scientific papers searching, reading, abstracting, contents organizing and discussion will be also practiced. Lectures are processed in small classes. After being given lectures on basic knowledge of English presentation, each student will have chance to give one or two 10-minute presentations on selected topics by themselves based on papers in the world leading scientific journals or in their own research fields. Questioning and answering will be carried out after each presentation, teacher's advice is followed. All lectures are given in English. The grades will be assigned according to attendance, performance in presentations and final reports.

Introduction to Intellectual Property Right

2 Credits Elective
5-7 Semester

This course aims to explain both patents and intellectual property in general, which have come under scrutiny due to the recent growth of the internet and advances in biotechnology. Specific case studies from highly experienced EU and US businesspeople, lawyers, and patent agents will be used, so even students with no legal background will be able to see how intellectual property rights are reflected in corporate technology development strategies.

Introduction to Biomedical Engineering

2 Credits Elective
7 Semester

The field of biomedical engineering contributes to the development and improvement of medicine, health care, and welfare by applying engineering technology to medical problems. This course will begin by giving an basic outline of medical and healthcare instruments. Next, it will explain in omnibus style how the various diagnostic/therapeutic devices and equipments are used in modern health care, and their basic principles.

Introduction to Electronic Engineering
2 Credits Elective
5-7 Semester

This course will outline the basic knowledge required by engineers in the fields of electrical, electronic, communications, and information engineering, then address the latest topics of these fields.
1. Electrical power systems and energy conversion.
2. Semiconductor integrated circuits and ultrafine processing technology.
3. Medical ultrasound engineering and life sciences.
4. Multimedia and communication formats.

Introduction of Engineering Chemistry
2 Credits Elective
3rd Semester

Introduction to Materials Science
2 Credits Elective
5-7 Semester

Human culture developed rapidly once it began using metals. However, not many people know what metals actually are. Through the use of standard diagrams utilized in the field of materials science, this course will provide simple explanations of metal manufacturing principles and processes, crystalline structures of pure and alloy metals, the relation between formation mechanisms and composition of strength and viscosity, the relation between defects and deformation mechanisms and changes in mechanical properties due to thermal treatment, etc.

Introduction to Environmental Engineering
2 Credits Elective
7 Semester

Human culture developed rapidly once it began using metals. However, not many people know what metals actually are. Through the use of standard diagrams utilized in the field of materials science, this course will provide simple explanations of metal manufacturing principles and processes, crystalline structures of pure and alloy metals, the relation between formation mechanisms and composition of strength and viscosity, the relation between defects and deformation mechanisms and changes in mechanical properties due to thermal treatment, etc.

Overseas Study I ~ IV

Credits of these lectures are approved according to a Study abroad experience that is organized by Tohoku University or partner universities. 0.5 credit is approved to a study abroad experience less than 10 days, while 1 credit is approved to an experience from 10 days to 3 months. Whether the credit can be counted in the graduation criterion of not depends on the department. Please check the notice board and ask the department when you have any question.

Institute of Engineering Education Special lectures
2 Credits Elective
1-3-5-7 Semester

(Marvels in Life and Nature)
This course fosters a deep compassion and cultivates a keen sensitivity to the many mysteries in nature and life.

Institute of Engineering Education Special lectures
2 Credits Elective
1-3-5-7 Semester

(Skills for Global Leaders)

Institute of Engineering Education Special lectures
1 Credits Elective
2-4-6-8 Semester

(Design and Engineering)
Through a special course on problem and project-based learning and an advanced creative engineering training program, this course helps students develop a sense of purpose and fosters a broad perspective, imagination, and teamwork.

Institute of Engineering Education Special lectures
1 Credits Elective
3-4 Semester

(Academic Reading)

Institute of Engineering Education Special lectures
2 Credits Elective
5-7 Semester

(Introduction to Management Science and Technology)
Offered in conjunction with the Innovative Leaders Center, this course provides a strategic approach to development through special classes on project management and an introduction to sociotechnical systems.
